Development and Evaluation of a Place and Route Flow using Virtuoso-GXL layout tool Suite

A THESIS
SUBMITTED TO THE FACULTY OF THE GRADUATE SCHOOL
OF THE UNIVERSITY OF MINNESOTA
BY

Arvind Vinod

IN PARTIAL FULFILLMENT OF THE REQUIREMENTS
FOR THE DEGREE OF
MASTER OF SCIENCE

Dr. Chris H. Kim, Adviser

May 2011

Acknowledgements

I would like to thank Prof. Chris H. Kim for his constant motivation and guidance for this thesis. This work would not have been possible without his constant encouragement, support and regular meetings. My association with Prof. Kim and his VLSI research group has given me the opportunity to work in the state of the art technologies, software and with the great minds in the VLSI field.

I would also like to thank Prof. Sachin S. Sapatnekar and Prof. Richard B. Moeckel for being a part of my thesis defense committee.

I would like to thank Youguang Wei from Professor Sapatnekar's lab for initiating work on this project and providing valuable support along the way.

I would also like to thank my labmates Wei Zhang, Pulkit Jain, Bongjin Kim, Kichul Chun, Seung-hwan Song, Ayan Paul, Ed Pataky, Xiaofei Wang and Abhishek Arun for their valuable suggestions and support during this work.

Dedication

This thesis is dedicated to my family and I am thankful to them for their support.

Abstract

In this work, the automatic placement and routing tools from Cadence Virtuoso(R)-GXL layout tool suite have been used to create a flow to allow automatic placement and routing of small to medium sized blocks using schematic or verilog gate-level netlist as input, for aiding the design of testchips. The flow has also been tried on a larger design and timing results are compared with results from a commercial P&R tool-Cadence Encounter(R) Digital Implementation System.

Introduction

Automatic Place & Route tools are available from different EDA vendors in the semiconductor industry today, and have matured significantly to meet its requirements of design closure. However the infrastructure for setting up these tools, including input files required by them is very complex and requires considerable manual effort before they can be actually deployed on any design. The design of testchip layout is still predominantly manual using Cadence Virtuoso(R)-Layout tool. The idea behind this work is to automate the layout of small logic blocks and their integration in the design of the testchip. The *Custom Digital Placer* and *Chip Assembly Router* from the Cadence Virtuoso(R)-Layout-GXL tool suite can be used to perform automatic placement and routing respectively, using the schematic or gate-level verilog netlist as input to the flow.

1. Placement Flow

The *Virtuoso Custom Digital Placer* can be used to perform a simple row-based placement of standard cell based designs. There are 2 styles of placement available as part of this tool:

Assisted CMOS Placement Style [1]*:* This placement style has different rows for NMOS and PMOS devices, and the number of these rows should be equal.

Assisted Standard-Cell Placement Style [1]: This placement style which has been used for this work, does standard cell based row placement, where standard cells are logic gates with a defined cell height. It also allows placement of bigger blocks which are a multiple of the standard cell height. These 2 placement styles can also be mixed [1].

1.1 Pre-requisites for Assisted Standard-Cell Placement

There are certain steps that need to be followed before running the actual placement tool. These are required to get a relatively clean layout from the placement process. The sequence of steps required is as follows:

- Ensure that individual standard cells are placement ready – this primarily means that they should be able to able to abut with any other cell in the design without violating DRC rules for the technology.
- The width of the VDD/GND power rails needs to trimmed to half the desired width i.e. use a value of 0.12um if the desired power rail width is 0.24u. This is to allow overlap of power rails between adjacent rows as is standard practice in our designs.
- All standard cells in the library should share a uniform orientation – vertical for horizontal placement rows. Make sure that the lower left corner of the standard cell is aligned with the origin in the layout editor window.

- All standard cells need to use standard vdd/gnd symbols to allow proper identification of vdd!/gnd! rails in the flow.
- The standard cells should not have their own PR-boundary layers, as this interferes with proper placement of the cells in rows.

1.2 Generate the initial layout for the cells from schematic

This step involves the invocation of Virtuoso(R)-Layout-GXL from the schematic to be placed, using

Launch->Layout GXL menu.

Use the following Skill command in the main Virtuoso command window in order to preserve the orientation of standard cells that will be generated using the subsequent step

envSetVal("layoutXL" "lxGenerationOrientation" 'string "R0")

The first step is to define standard cells to be used in placement using the

Configure Physical Hierarchy Editing Menu – Launch-> Configure Physical Hierarchy..

The following menu will appear.

Select the *Component Types* option from this menu. In the “Cells” section right-click and create a component type with the “Add Component Type” and name it. Then expand the cells under “No Component Type” and move cells to the newly created component type by selecting all cells and using “Move cells” to the new ‘component type’. In the ‘Attributes’ section for the new “Component type” change the “Component class” to **STDCELL**. Save changes and close this window.

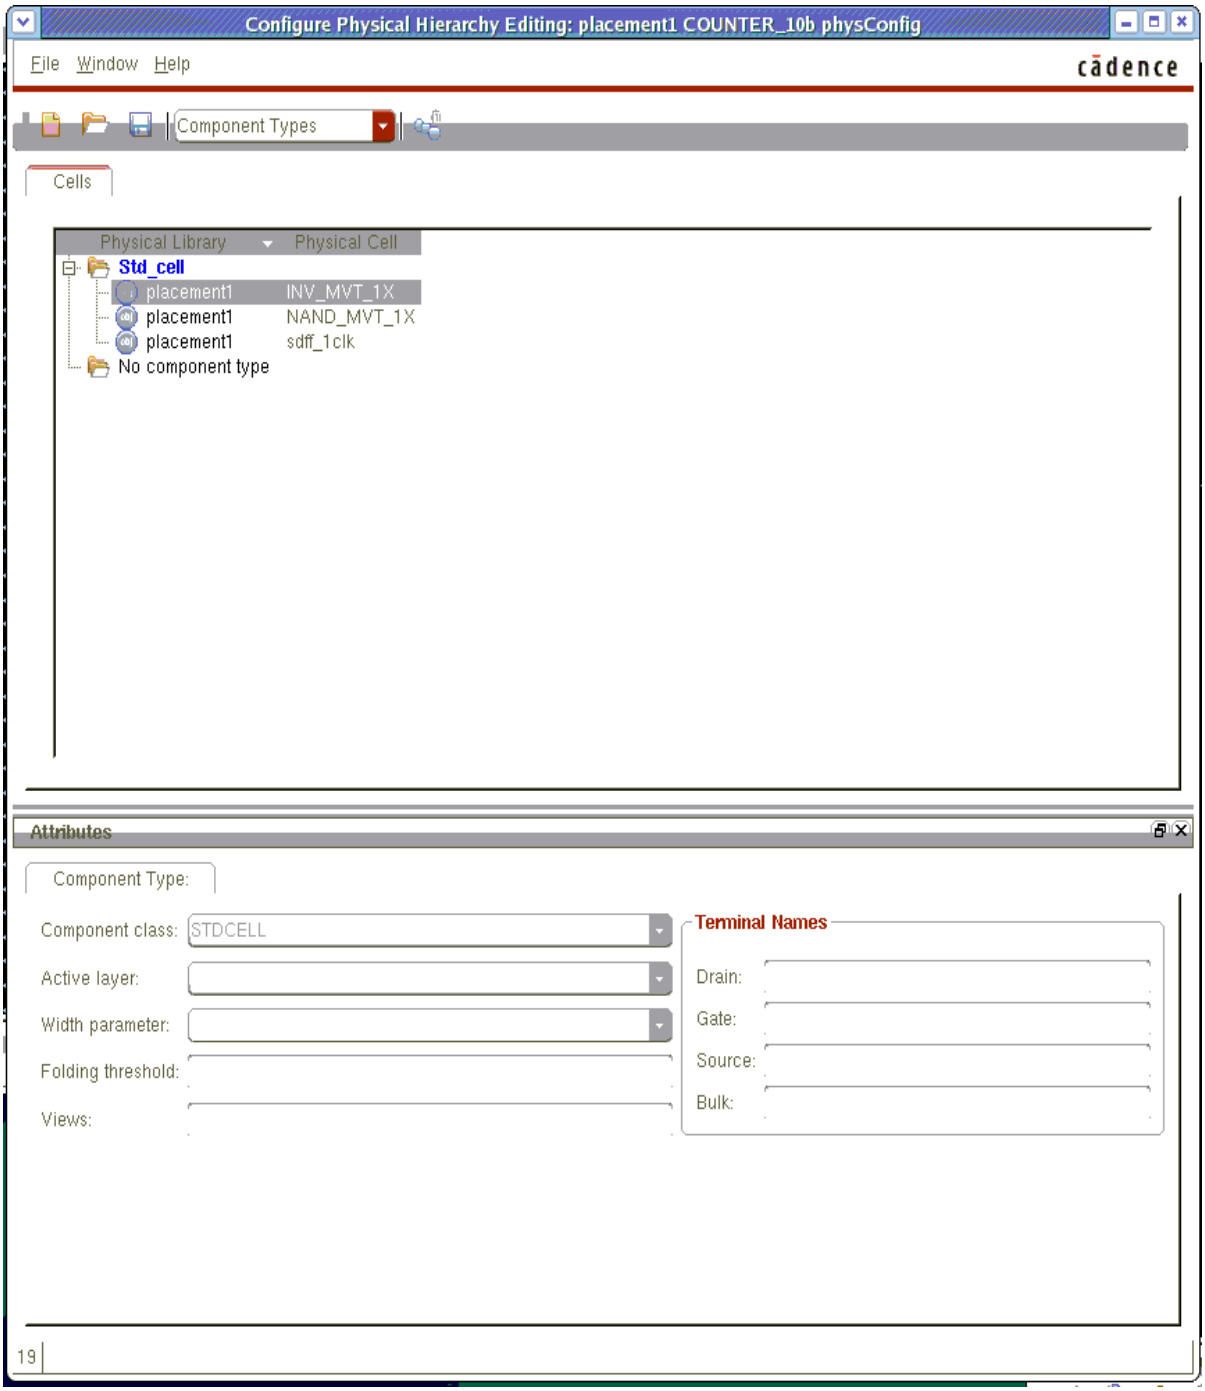

Fig 1. Standard cell Component type addition

Next, click connectivity->Generate->All from source. The following menu appears. The *Boundary Area Estimation* section can be used to define the dimensions or the aspect ratio of the placement region.

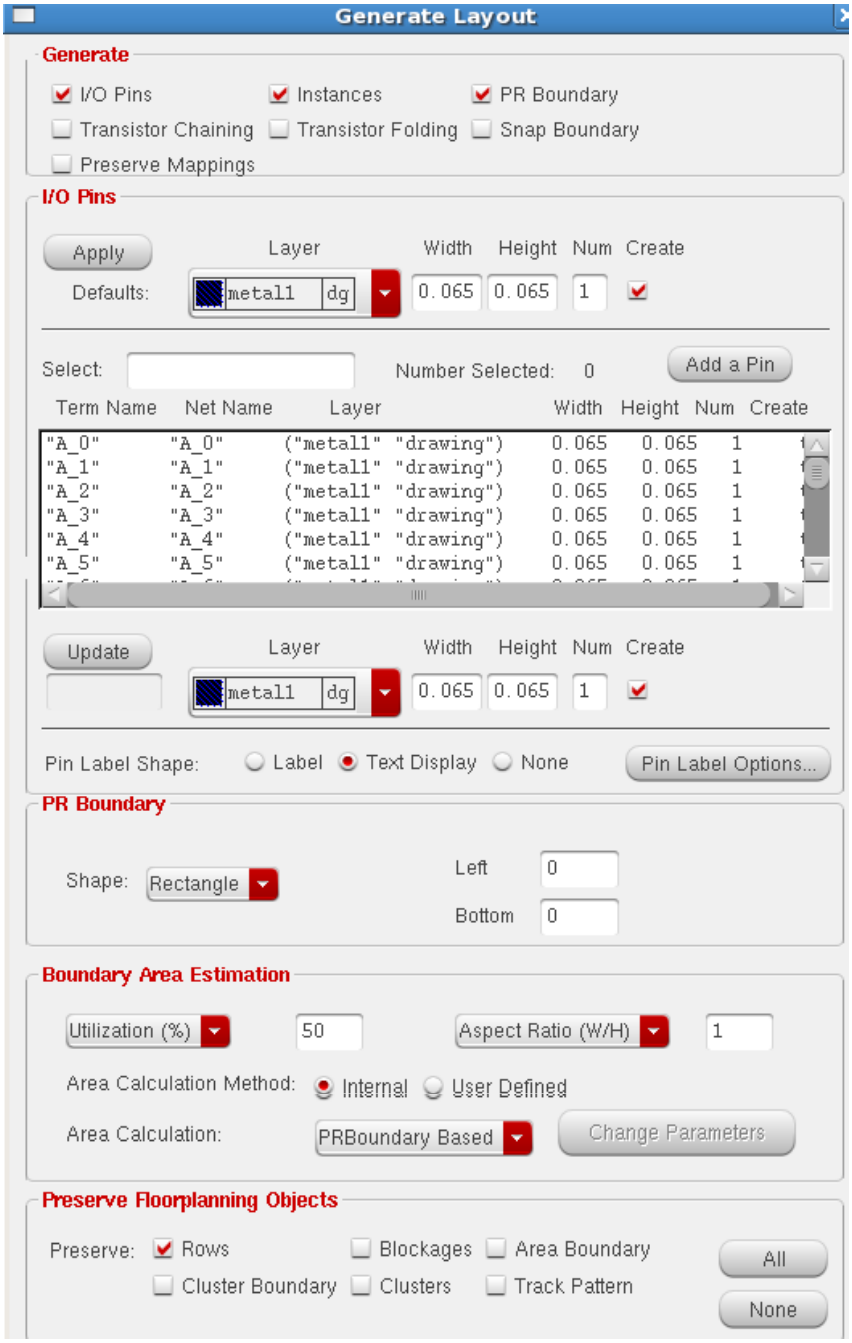

Fig 2. Layout Generation From Schematics – *Generate layout* menu

1.3 Running Virtuoso Custom Digital Placer

The following is a sequence of steps to run the *Virtuoso Custom Digital Placer*:

- Select the “Custom Digital Placer” using the menu->Windows->Assistants-> Task Assistant, and checking on “Custom Digital Placer”. The “Placement Planning” and the “Digital Placer” icons should show up at the bottom of the layout XL window.
- Invoke the “Placement Planning” menu by clicking on the icon. Select the “Assisted Standard-Cell” using the “Style” dropdown menu. There are multiple tabs that need to be configured here to guide placement.
    - In the “Regions” tab, check the “Allow for Pins” to allow pin placement outside the rows and “Allow Rows beyond regions” to allow expansion of rows for initial iterations of placement.
    - In the “Rows” tab set the “Utilization Inside Rows” to 100% to fully utilize row area for cells. Also check the “% Area Covered By Rows” and select “Specify” and set it to 0. This is again to allow overlap of VDD/GND power rails in adjacent rows. We will update the section about “Use Filler Cells” and “Use Substrate Contacts” at a later point, but for now we will add these manually.
    - In the “Rails” tab select the metal layers used for routing the vdd!/gnd! rails(typically metal1). Name the rails as **vdd!** and **gnd!**. Enter the half-width for both rails in the “Width” fields as explained earlier, in order to allow overlap of VDD/GND power rails. Select the G-P-P-G in the “Pattern” field and enter the cell height (centre-centre distance between power rails) in the “Rail To Rail Spacing” field.

- Click on “Calculate Rows” to see the placement rows created by the tool.

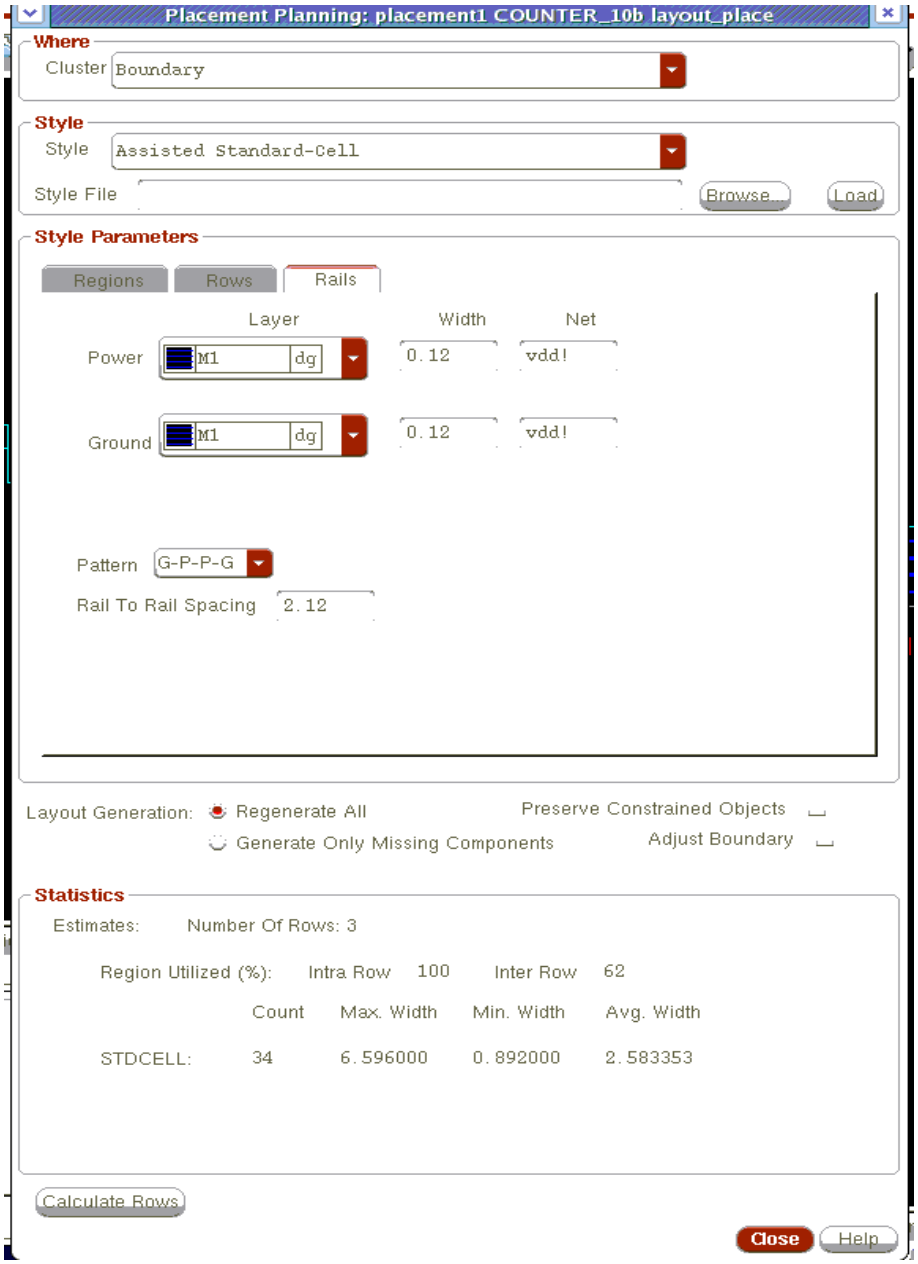

Fig 3. Virtuoso Custom Digital Placer – Placement Planning window

- Invoke the placer by clicking on the “Digital Placer” icon. Check only the following options:
    - Allow Rotation

- Global Placement
- Optimize Placement – you can use different “Runtime” options depending on the size of the design and runtime requirements.
- Do not check any of the “Spacer” options. Click OK to run the placer.

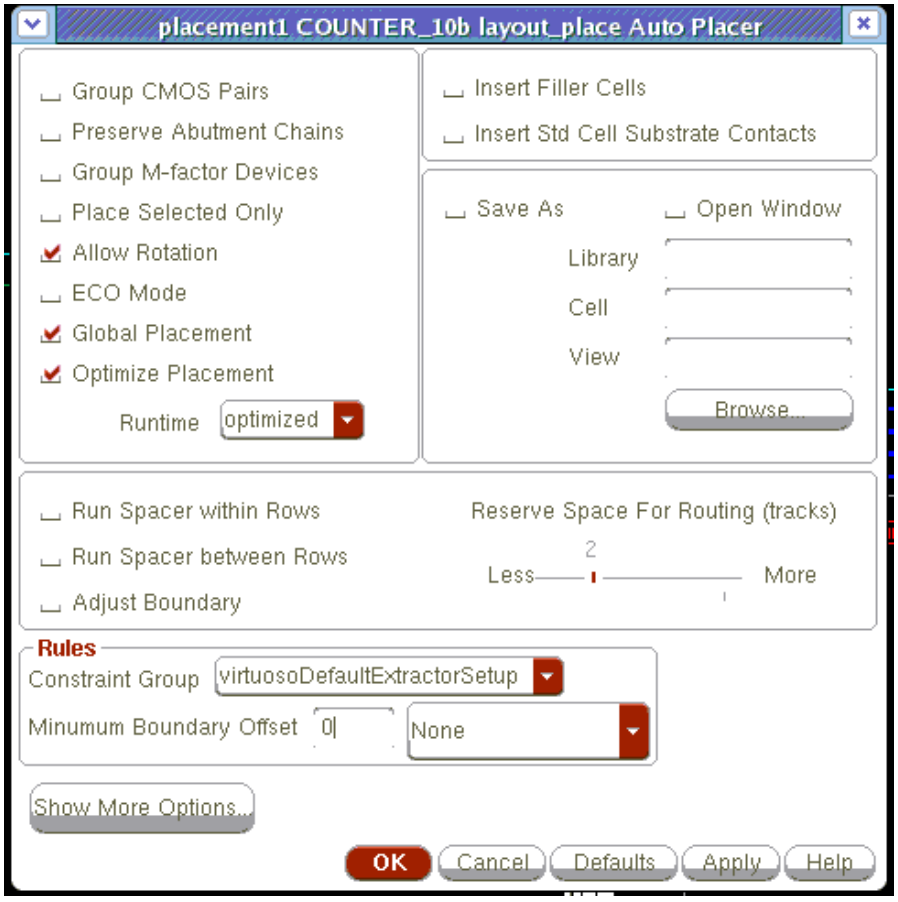

Fig 4. Virtuoso Custom Digital Placer – Auto Placer window

The procedure for hierarchical placement of pre-placed is quite similar to placement for individual blocks. The same pre-requisite steps need to be done on the pre-placed blocks to be placed to form bigger blocks. **Figure 5** shows an example with 2 10-bit counters and a NAND gate after placement.

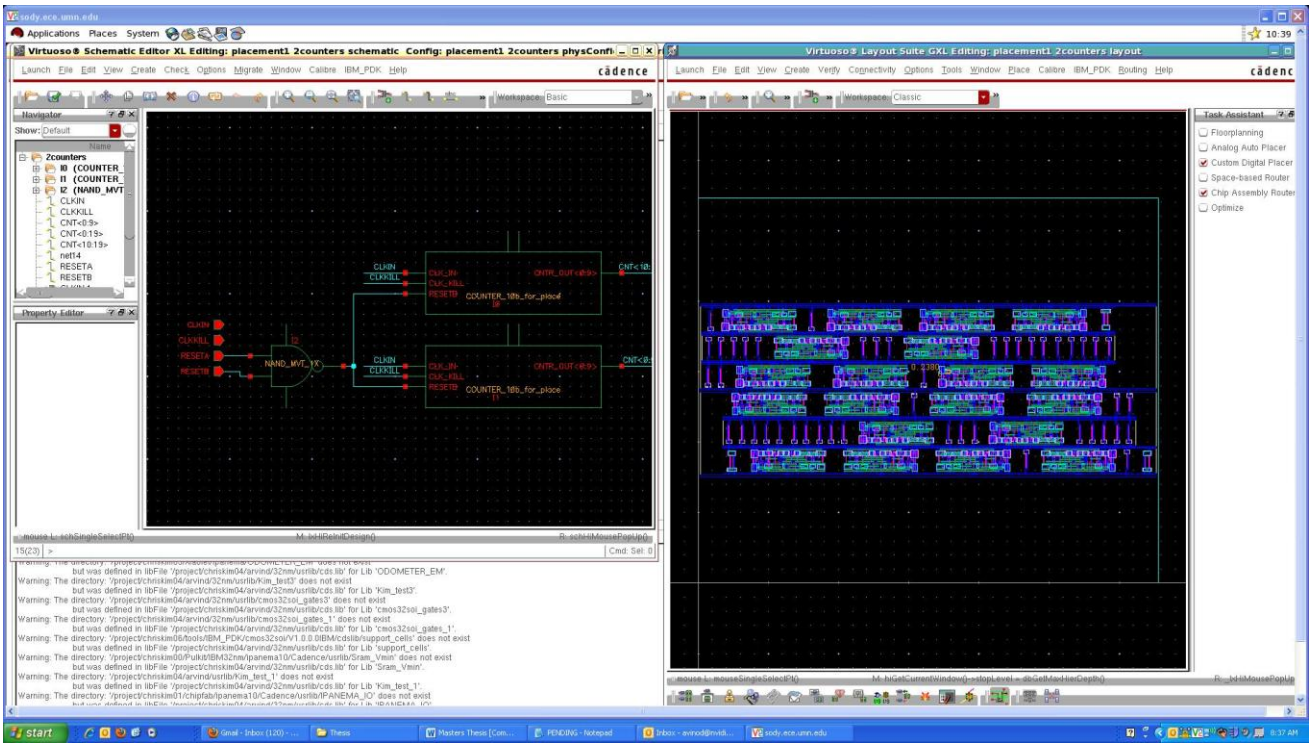

Fig 5. Virtuoso Custom Digital Placer – Hierarchical placement

2. Routing Flow

The *Virtuoso Chip Assembly Route* is the tool used for global and detailed routing in Virtuoso. The sequence of steps for running the router is as follows:

- Select the router using the *Windows->Assistants-> Task Assistant*, and checking on "Chip Assembly Router". The *Start Router* icon should show up at the bottom of the layout XL window. Invoke the router by clicking on the icon.
- Invoke the *Pin Escape* menu using *Autoroute->Pre route->Pin Escape.* The pin_escape command is a preroute command that routes a short wire from a via to a pin [2].
- Next invoke the global router using *Autoroute->Global Route->Global Route.* Run the global router for at least 25 passes on a large design.
- Following this the detailed router is invoked using *Autoroute->Detail Route ->Detail Router.* Run it for a sufficient number of passes in order to get a 100% routed design.
- In order to remove U-shaped notches formed by metal layer for the same net, run *Autoroute->Post Route->Remove Notches*

For smaller blocks it is preferable to have pins in M2 or above since the router finds it difficult to route M1 due to extensive use inside the standard cells.

If pins need to be placed manually they should be un-checked in the *Generate Layout* menu prior to placement, and then routed manually, after running the router to route internal nets.

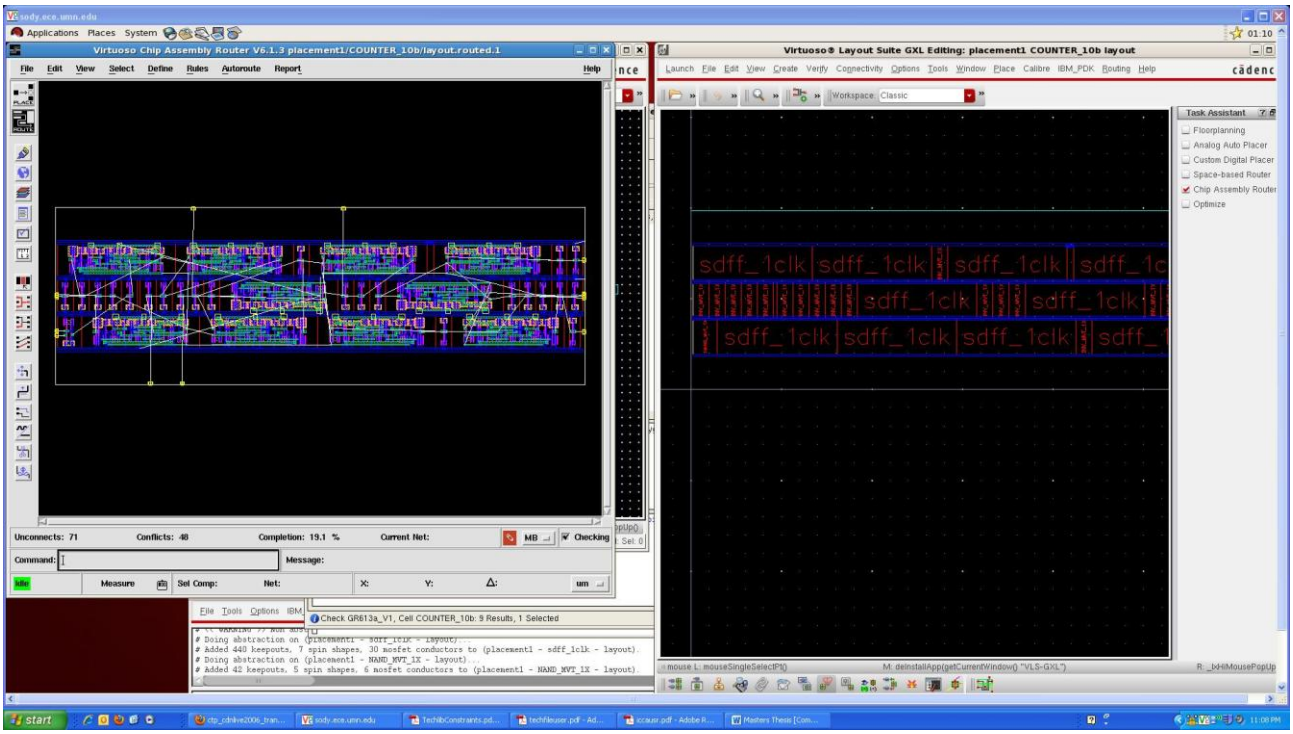

Fig 6. Virtuoso Chip Assembly Router window

2.1 Technology File Modification for Routing

The technology library can be modified to guide the router to improve DRC cleanliness, via placement of the routed design [5][6]. For the Open Access library format (used by Cadence version IC61*), different sections of the technology library database can be dumped using the *Technology Tool Box*, which can be invoked from *Tools->Technology File Manager* from the main Virtuoso command window.

As seen in **Figure 7** different sections of the technology file can be written using the

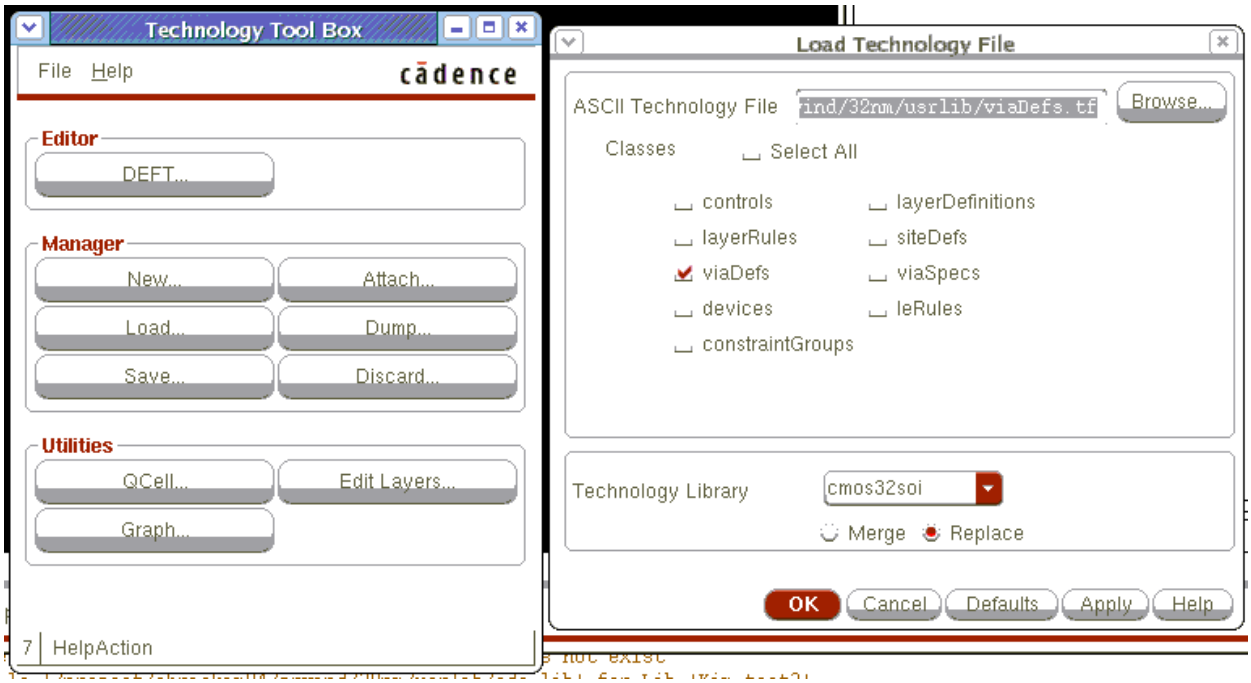

Fig 7. Virtuoso Technology Tool Box – loading changes to technology file

Dump option and loaded selectively into virtual memory using the *Load* option. The technology library for the given PDK should be selected in the *Technology Library* field.

The following is a brief description of different sections of the technology file [6]:

Controls (controls) specify data that can be used throughout the technology file and also specify references to other technology libraries.

Layer definitions (layerDefinitions) define the layers that can be used to define data throughout the technology file or by other technology databases in design sessions.

Layer rules (layerRules) specify layer attributes, such as layer materials, manufacturing grid resolutions, and current densities.

Constraint groups (constraintGroups) specify design constraints.

Site definitions (siteDefs) define scalar site definitions and arrays of scalar site

definitions.

Via definitions (viaDefs) define standard and custom vias.

Via specifications (viaSpecs) define arrays of via definitions.

Devices (devices) define Cadence-predefined MOS and ruleContact devices andmultipart path templates.

The *constraintGroups* section of the technology file can be used to control the following

- The metal layers which get used for routing, by listing the metals used to route in the *validlayer* section:

```
( "virtuosoDefaultSetup" nil
; layer constraints
interconnect(
( validLayers   (M1  M2  M3  M4   ) )
( validVias     (M2_M1 M2_M1_via  M2_M1_viaB  M2_M1_viaC M3_M2 M3_M2_via M3_M2_viaB
M3_M2_viaC M4_M3 M4_M3_via   M4_M3_viaB  ) )
);interconnect
);virtuosoDefaultSetup
```

- Using the *spacingTables* section, spacing between metal routes of the same layer can be controlled based on the width and length of the metal route [6]:

```
constraintGroups(
("foundry"
spacingTables(
;( constraint layer1
; (( index1Definitions index2Defintions) defaultValue)
; ( table) )
;( ------------------------------------------)
( minSpacing "Metal1"
(( "width" nil nil "length" nil nil ) )
(
(0.0 0.0 ) 0.12
(0.0 0.56 ) 0.12
(0.0 1.5 ) 0.12
(0.0 3.0 ) 0.12
(0.1805 1.5 ) 0.18
(0.1805 3.0 ) 0.18
(1.5005 1.5 ) 0.5
 (3.0005 1.5 ) 0.5
(3.0005 3.0 ) 0.9
```

```
)    )
) ;spacingTablesmetal table spacing
```

The *viaDefs* section of the technology file can be used to control the metal enclosure of vias:

```
viaDefs(
 standardViaDefs(
 ;( viaDefName  layer1  layer2  (cutLayer cutWidth cutHeight [resistancePerCut])
 ;   (cutRows   cutCol  (cutSpace))
 ;   (layer1Enc) (layer2Enc)    (layer1Offset)  (layer2Offset)  (origOffset)
 ;   [implant1   (implant1Enc)  [implant2       (implant2Enc) [well/substrate]]])
 ;( ---------------------------------------------------------------------------- )
  ( VSPC_M1            PC         M1               ("CA" 0.04 0.04 0.7)
    (1 1 (0.064 0.064))
    (0.0 0.0)  (0.0 0.0)      (0.0 0.0)      (0.0 0.0)      (0.0 0.0)
  )
  ( VSRX_M1            RX         M1               ("CA" 0.04 0.04)
    (1 1 (0.064 0.064))
    (0.0 0.0)  (0.0 0.0)      (0.0 0.0)      (0.0 0.0)      (0.0 0.0)
  )
  ( VSM1_M2            M1         M2               ("V1" 0.05 0.05)
    (1 1 (0.08 0.08))
    (0.017 0.0)       (0.017 0.0)    (0.0 0.0)      (0.0 0.0)      (0.0 0.0)
  )
 ) ;standardViaDefs
) ;viaDefs
```

Note that these are just a few examples of how the routing process can be controlled using the technology file. Also in order for these changes to take effect the relevant section should be *loaded* using the ***Merge*** option in the *Technology Tool Box.*

Other parameters which are defined in the *foundry* section of the *constraintgroups* which can be useful to control the router are as follows:

```
spacings(
    ( minSpacing              "RX"     0.10 )
    ( minSpacing              "V1"     0.10 )
    ( minSpacing              "PC"     "CA"              0.010 )
    ( minSameNetSpacing       "RX"          0.10 )
    ( minSameNetSpacing       "M1"          0.10 )
    ( minSameNetSpacing       "M2"          0.10 )
    ( minSameNetSpacing       "M3"          0.10 )
    ( minSameNetSpacing       "CA"          "V1"              0.0 )
    ( minSameNetSpacing       "V1"          "V2"              0.0 )
    ( minWidth              "M1"     0.10 )
    ( minWidth              "CA"     0.10 )
    ( minWidth              "V1"     0.10 )
    ( maxWidth              "M1"     2.00 )
    ( minArea               "M1"     0.10 )
    ( minArea               "M2"     0.10 )
    ( minArea               "M3"     0.10 )
    ( minViaSpacing           "V1"   0.10 )
    ( minViaSpacing           "V2"   0.10 )
    ( viaSpacing            "CA"     (3 0.20 0.20) )
    ( viaSpacing            "V1"     (3 0.20 0.20) )
    ( viaSpacing            "V2"     (3 0.20 0.20) )
   ) ;spacings
```

A minimum spacing - *minSameNetspacing* must be maintained between two electrically equivalent shapes (typically, the “notches” in wires that are created by some tools). If this minimum cannot be met, the notch space must be filled [5]. *minSameNetspacing* should be used only when it is less than the MinSpacing.

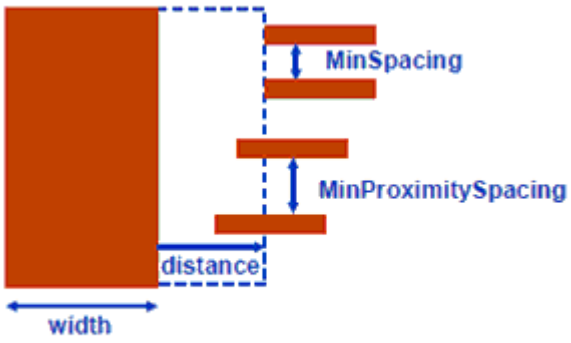

Fig 8.a minSameNetSpacing

Fig 8.b MinProximitySpacing

Proximity rules are used to set perpendicular wire spacing close to wide wires, as shown in **Figure 8.b** [5]. This can be set directly from the router using the following command:

rule layer M1 (proximity on (influence (width 5.0 within 1.0 clear 1.0) (width 7.5 within 2.5 clear 2.5))

Figure 9 shows DRC violations for a 10-bit counter layout, that can be fixed by editing the technology file. **Table 1** provides a summary of the sections of the technology file that need to be changed. Note that these changes may result in a slightly higher area, but that usually is not a major concern for testchips. The tradeoff lies in relatively DRC clean layout from the router.

Table 1. Sections of Technology file to be edited for DRC clean routing

Fig 10. DRC violation from routing

However in spite of all these manipulations to the technology file for running the router, there are still some DRC violations that arise as a result of routing. An example of such a violation is as shown in the **Figure 10** above, where a small corner notch is formed by the routing metals giving rise to violations. For now these violations need to be corrected manually, but there should be an automated solution which needs to come up as part of future work.

Another class of DRC errors still seen were related to the number of via cuts that are placed for wide metal overlap regions. Although the technology filw has a setion – *minNumCut* the tool does not honor these properly.

Virtuoso Custom Digital Placer & Chip Assembly Router were run on a 10-bit counter block with some of the above fixes attempted to obtain a DRC clean layout. The results are shown below in **Figure 11a**. **Figure 11.b** shows the DRC and LVS results for the final layout after some manual edits.

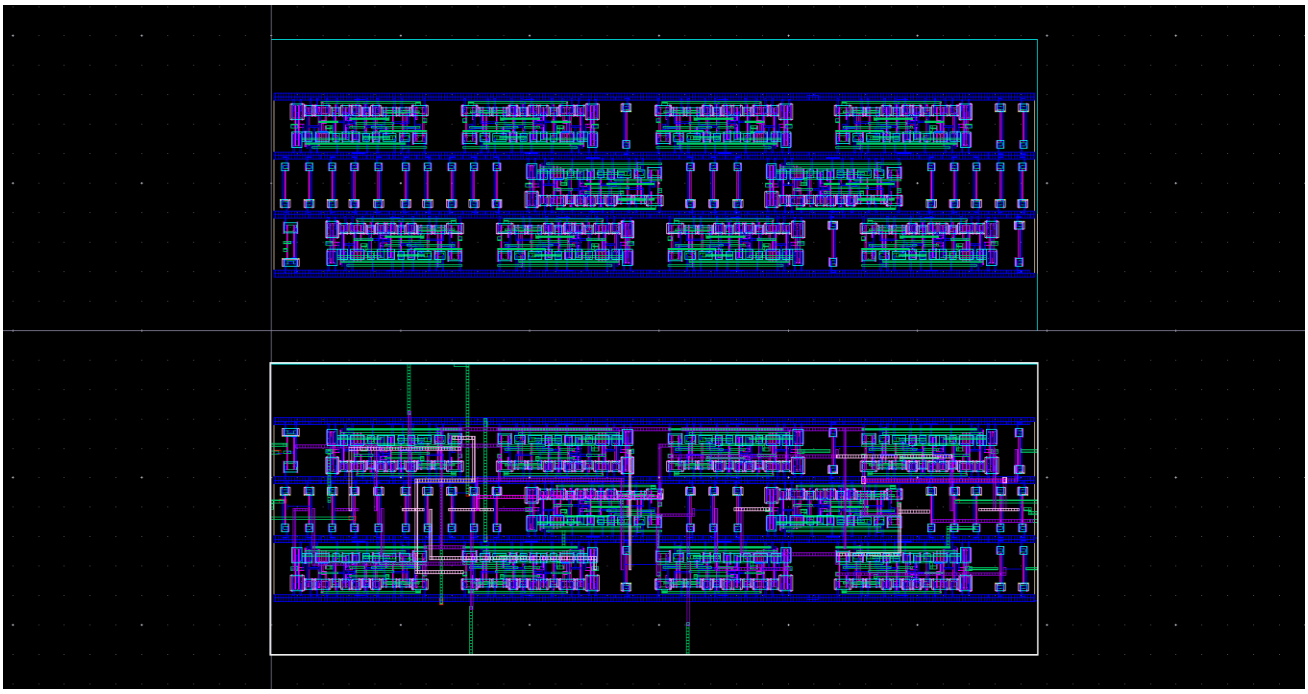

Fig 11.a. Layouts after Placement and Routing

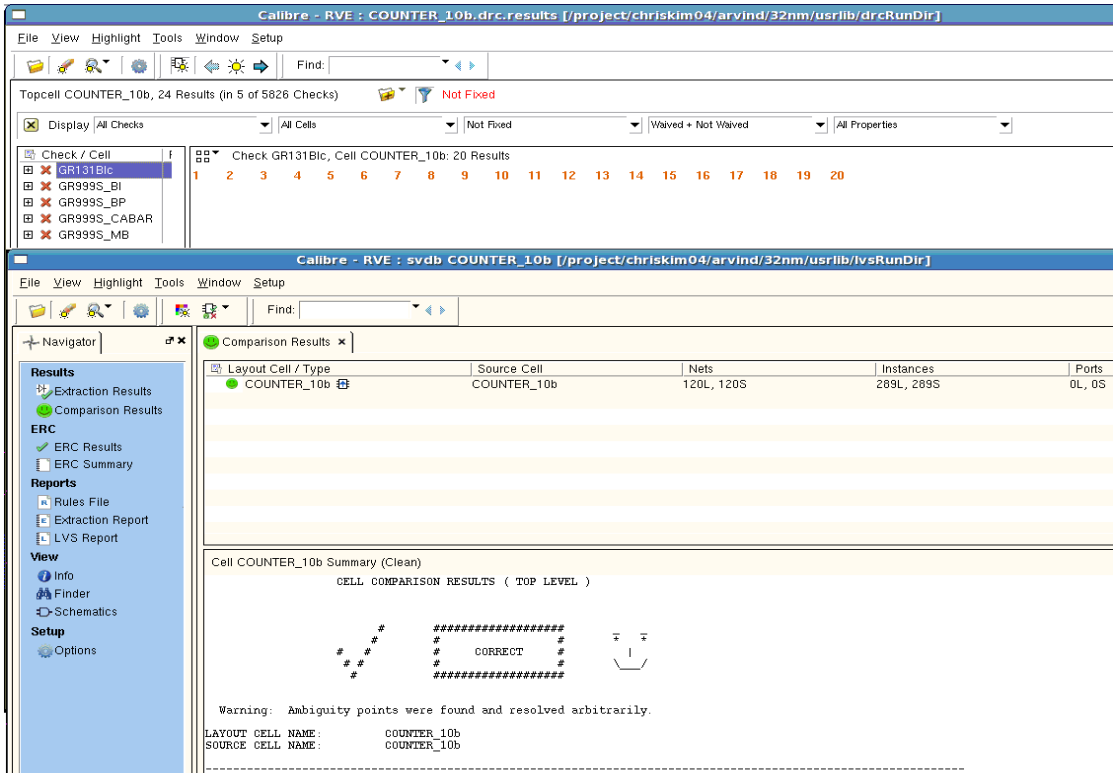

Fig 11.b. DRC and LVS results – DRC errors occur since it is a standalone block

DRC results for 10-bit counter block after technology file modification

In order to get a relatively DRC clean layout from the Virtuoso Chip Assembly Router the following edits were made to the technology files for 32nm and 65nm PDKs:

- Changed metal minimum spacing, minimum area and minimum width requirements of metal layers to adhere to certain DRC violations at the cost of slightly higher layout area.
- Changed metal enclosure of vias for these metal layers - M2/3/4/5/6/7. This was done to to take care of minimum area DRC violations for stacked vias. M1 enclosure of vias was not changed because of higher metal density for M1.
- Selectively change metal enclosure of vias when there are multiple kinds of vias between the same 2 metal layers. For eg. different M2 enclosure for the 3 types of vias to allow the router to choose the via to meet metal spacing & area DRC rule requirements together.
- Changed validlayers to remove poly and other metal layers not desired for routing, to preclude their use for routing.

Figure 12 below shows the improvement in DRC results before and after making edits to the technology file for the 32nm and 65nm PDKs.

As mentioned before the violations that are left after modifying the technology file are to do with the following:

- L-shaped metal noteches
- Minimum number of via cuts for wide metal overlaps

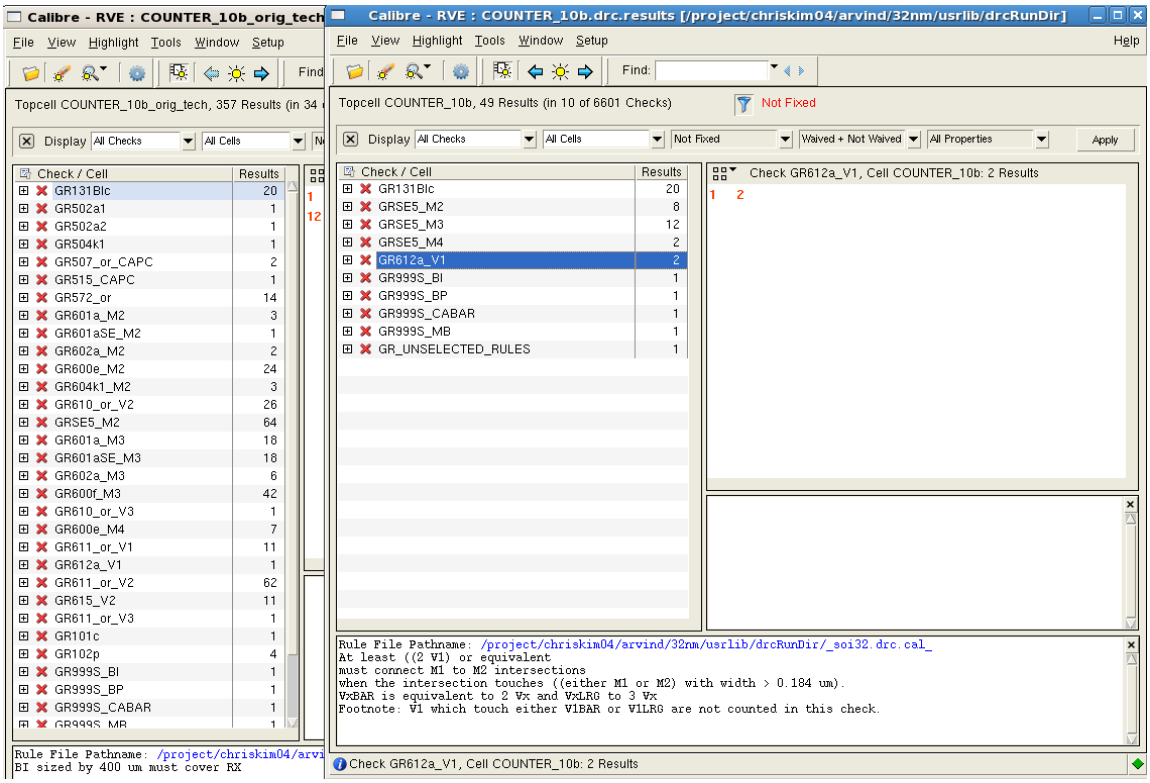

Fig 12.a. 32nm DRC results comparison

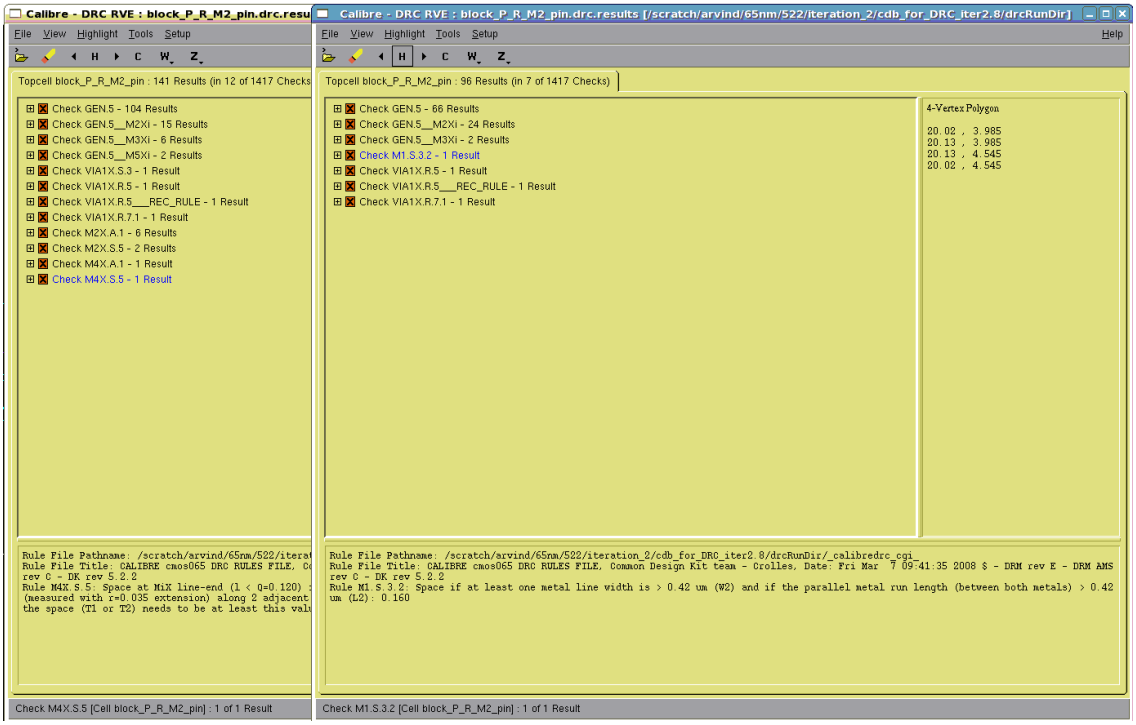

Fig 12.b. 65nm DRC results comparison

3. Timing Comparison between Encounter and Virtuoso-GXL P&R tools

In order to evaluate this flow, *Virtuoso Custom Digital Placer* and *Virtuoso Chip Assembly Router* were run on a larger design and timing results were compared with an industry standard place and route solution – *Cadence Encounter Digital Implementation System XL(R)* [4].

For this run the testcase used was an Advanced Encryption System core – aes_cipher_top - from *http://opencores.org* [7]. This gate-count for this core is 9809. For both the runs the design was attempted to close timing at a clock period of 2.5ns (400 Mhz) using a 65nm PDK from ST Microelectronics. The corners used for this analysis were as follows:

Min corner: Strong process, VDD=1.1V, Temperature= -40C

Max corner: Weak process, VDD=0.9V, Temperature= 125C

3.1 Encounter P&R flow

The gate-level netlist and Synopsys Design Constraints (SDC) file were run through a basic Encounter P&R flow as shown in **Figure 13** below. The flow was run using a 7-metal layer process.

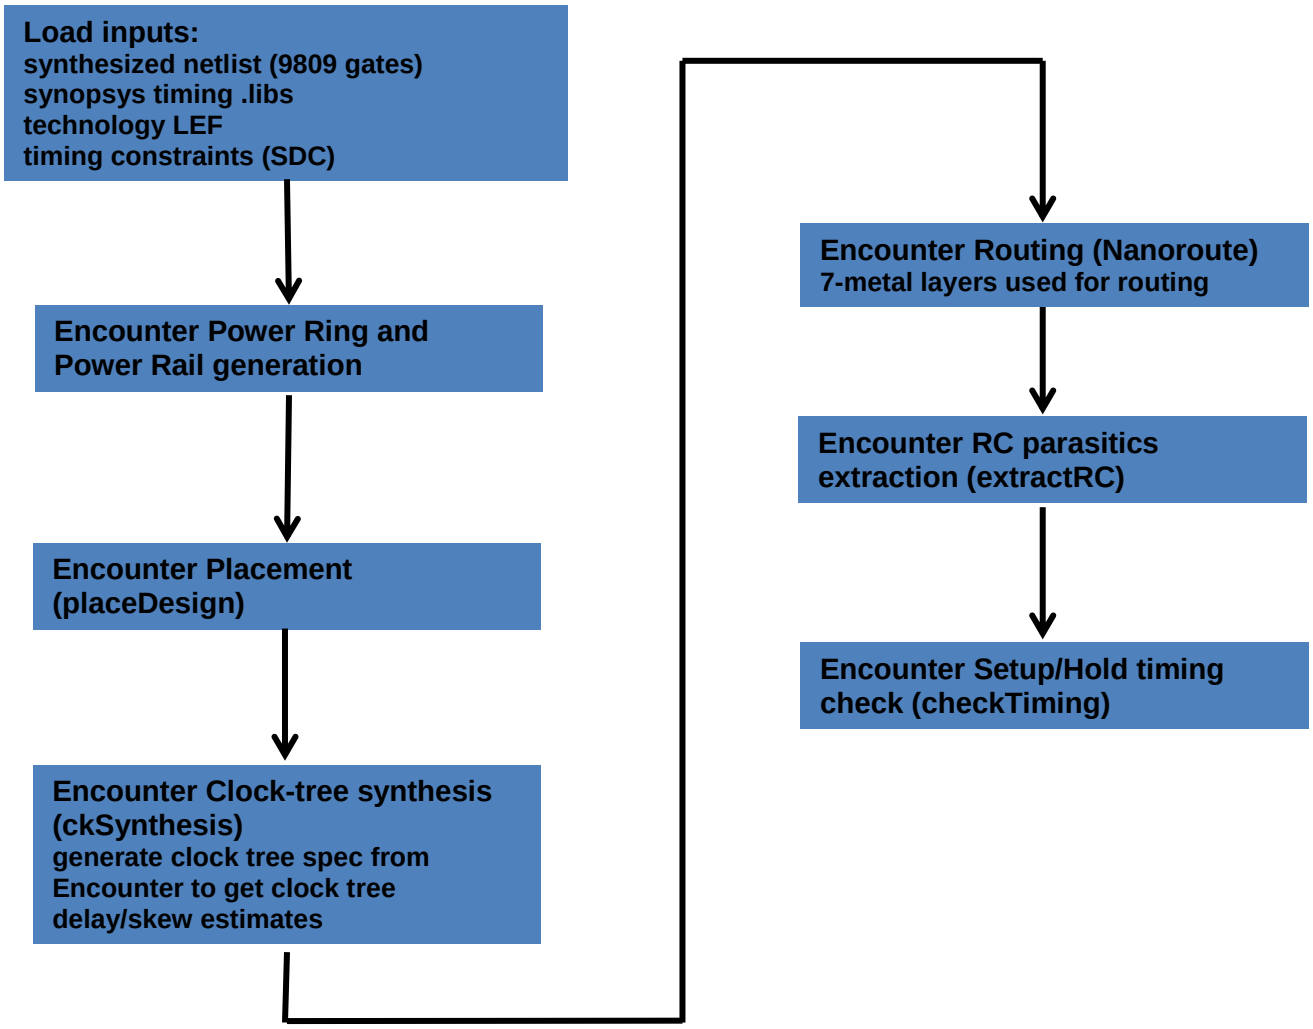

Fig 13. Encounter Place & Route flow

Static timing analysis using worst and best timing corners for setup and hold was performed within Encounter, which revealed 9 paths which violated slack for setup at a clock period of 2.5ns. The worst negative was -0.036ns. Hold timing for the design was closed during this run. The following **Figure 14** shows timing snapshot of the worst setup and hold paths from this run.

Fig 14.b. Encounter Worst Hold Timing paths

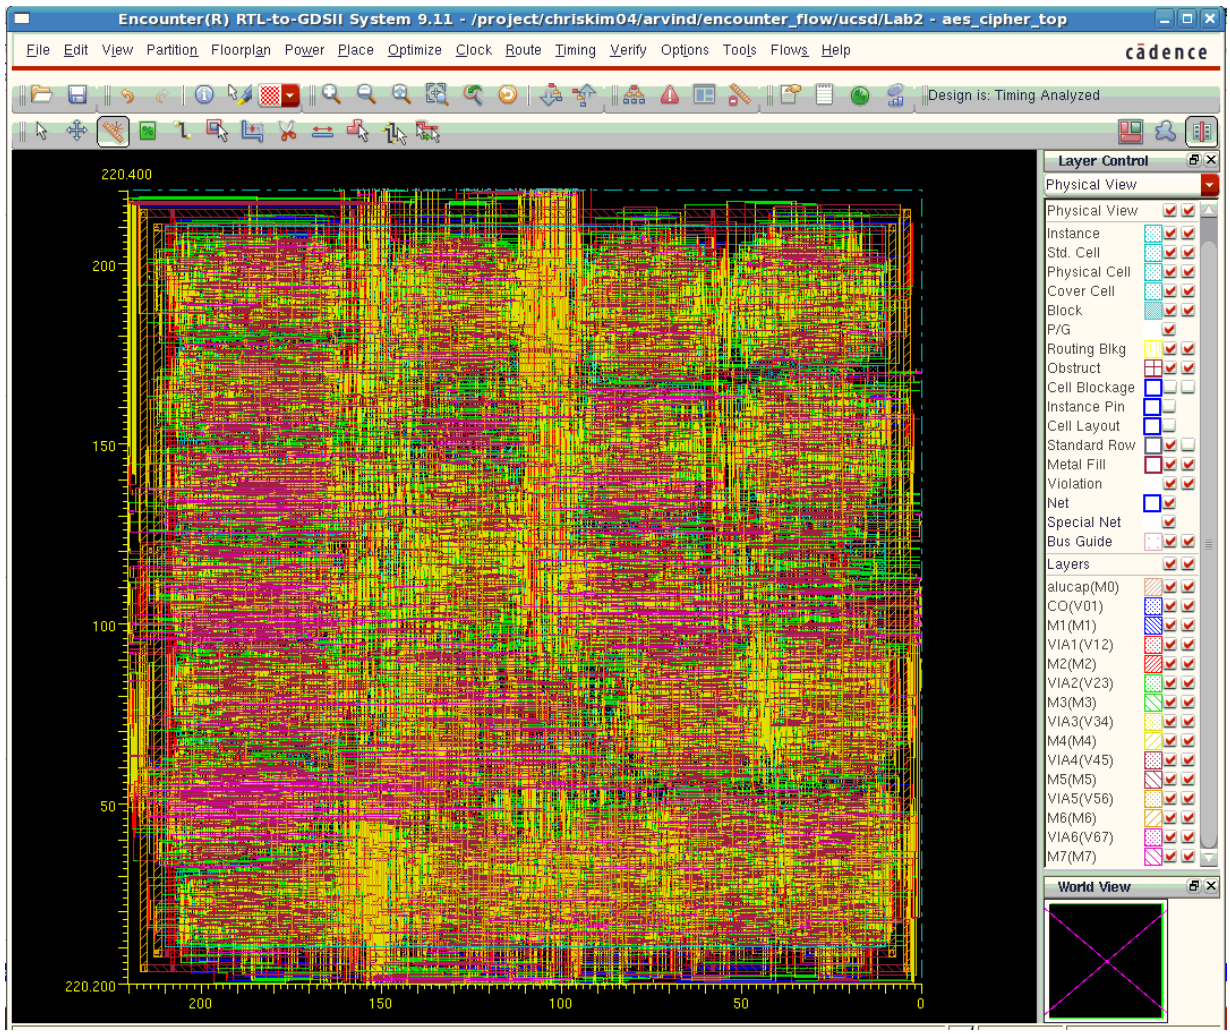

Fig 15. Encounter Place & Route run

3.2 Virtuoso-GXL P&R flow

Next the gate-level netlist were run through a basic Encounter P&R flow as shown in **Figure 15** below. The router was restricted to using 7 metal layers in order to be consistent with the Encounter flow.

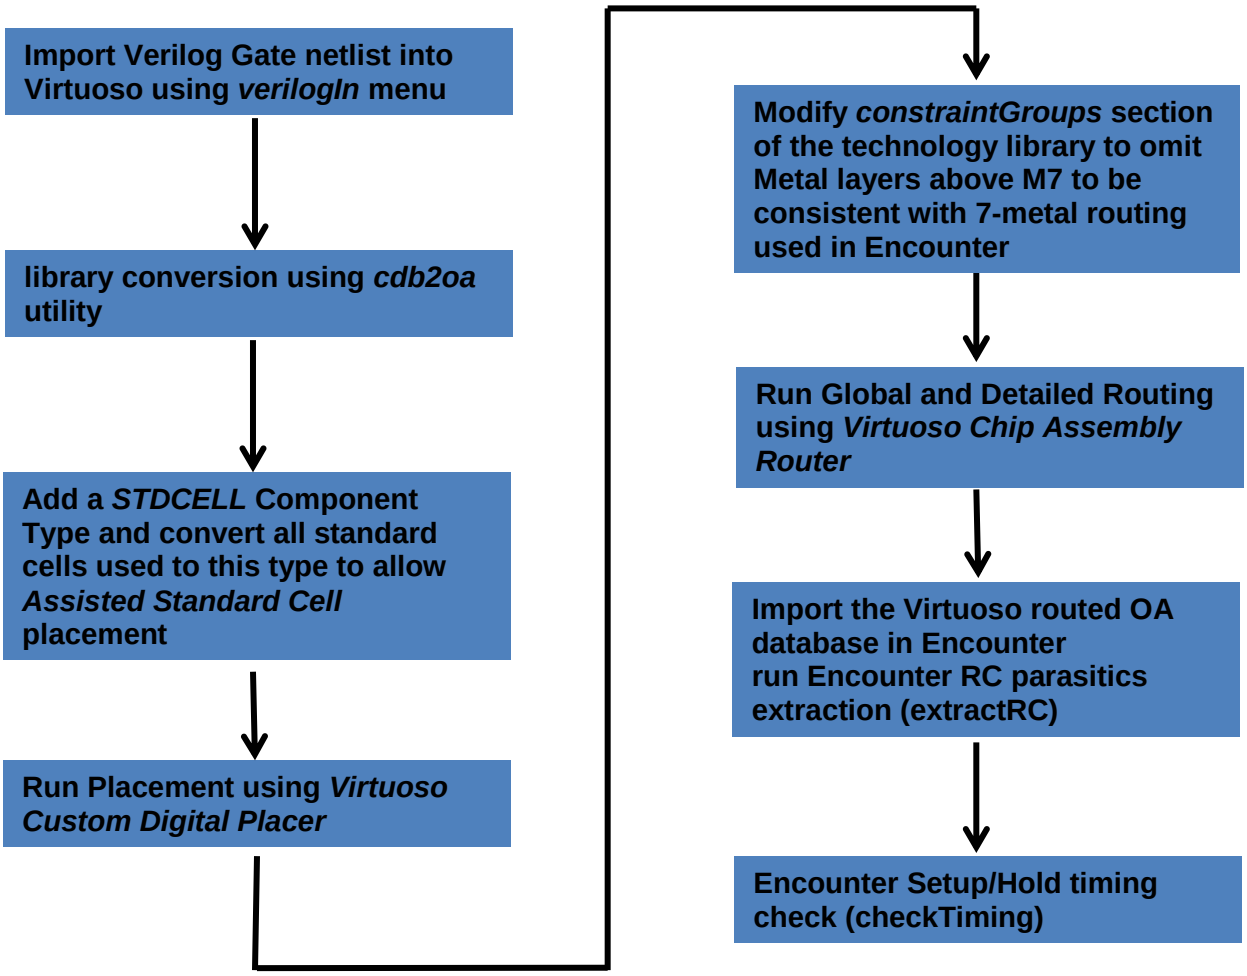

Fig 16. Virtuoso-GXL Place & Route flow

3.2.1 VeilogIn

The *VerologIn* menu (*File->Import->Verilog*) can be invoked from the main *Virtuoso* command window, for directly importing the gate-level netlist and standard cell libraries. The destination library to which the design should be imported can also specified.

3.2.2 CDB to Open Access Conversion (*cdb2oa*)

The cdb2oa utility can be used to migrate any PDK from Cadence version IC5.1.41 to IC6.1, to create a syntactically correct techfile [6]. Since the ST Microelectronics libraries were created using Cadence version IC5.1.41, and the Layout-GXL tool suite is only available as part of Cadence version IC6.1, the technology library, standard cell libraries and the design library all need to be converted to Open Access format to be used in IC6.1. This utility can be invoked as follows:

cdb2oa -cdslibpath <dir path of source library> -lib <source library name> -log <logfile>

Note that the technology library needs to be converted first before converting the standard cell and design libraries.

After the design was placed and routed within *Virtuoso-GXL*, the Open Access database is directly imported into Encounter using the *Design Import* (*File->Import Design*) form, as shown in **Figure 17**.

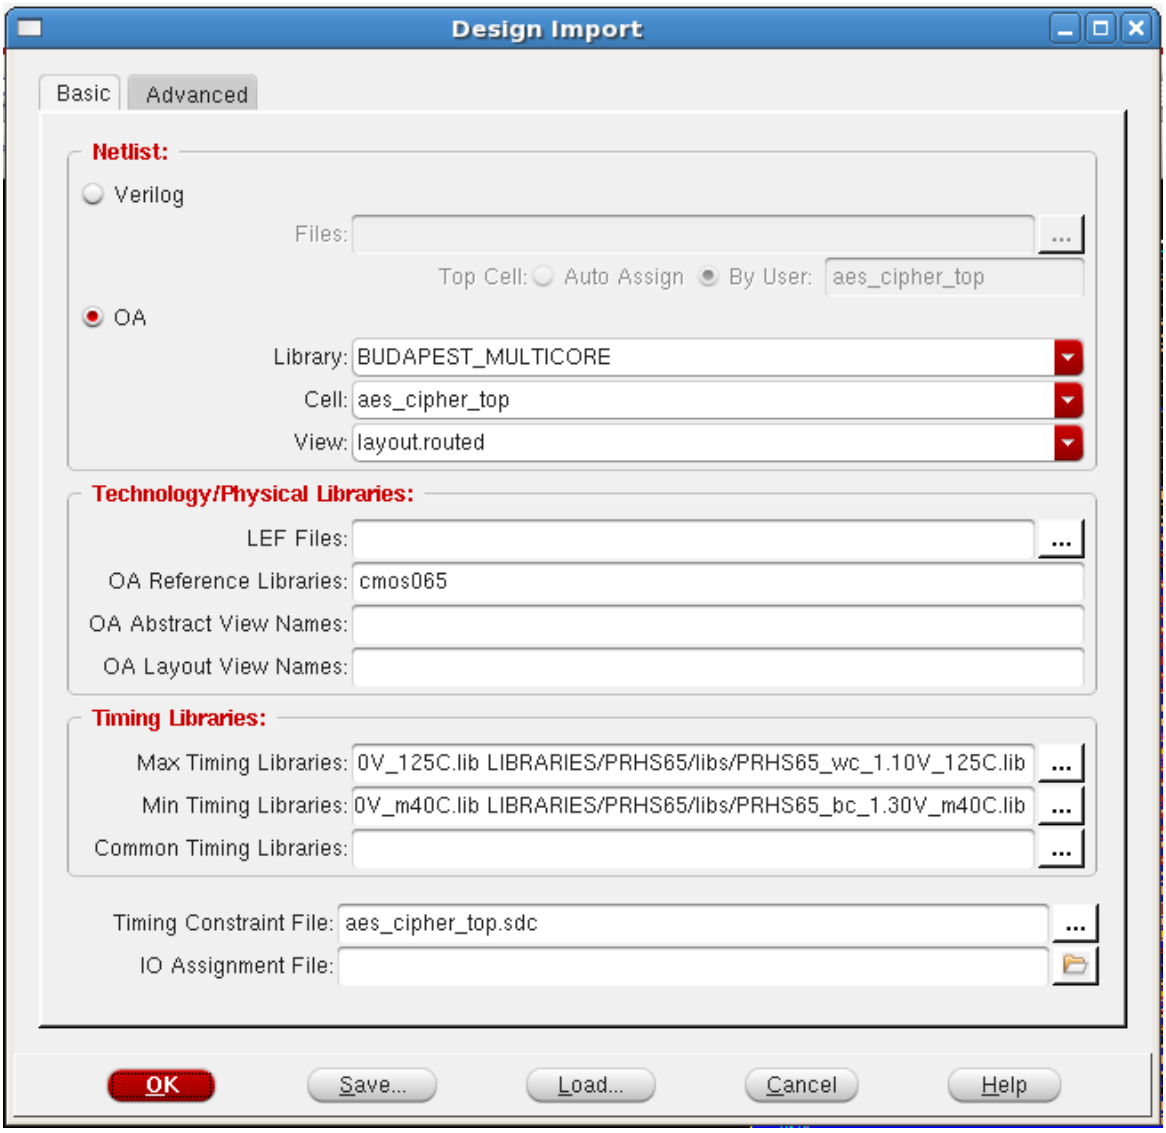

Fig 17. Encounter Open Access import from Virtuoso-GXL

Following this RC parasitics were extracted and static timing analysis using worst and best timing corners for setup and hold was performed within Encounter. However here the worst path violating setup was had a negative slack as large as -1.42ns The clock period was 2.5ns. Hold timing for the design was closed during this run. The following **Figure 18** shows timing snapshot of the worst setup and hold paths from this run.

Fig 18.b. Virtuoso-GXL Worst Hold Timing paths

The following **Figure 19** gives slack profile of the number of paths violating setup timing, from the *Virtuoso-GXL* P&R run. A total 199 paths are violating setup timing.

Violating Slack	No. of Paths
1.2-1.4 ns	1
1.0-1.2 ns	7
0.8-1.0 ns	11
0.6-0.8 ns	11
0.4-0.6 ns	26
0.2-0.4 ns	64
<0.2ns	80

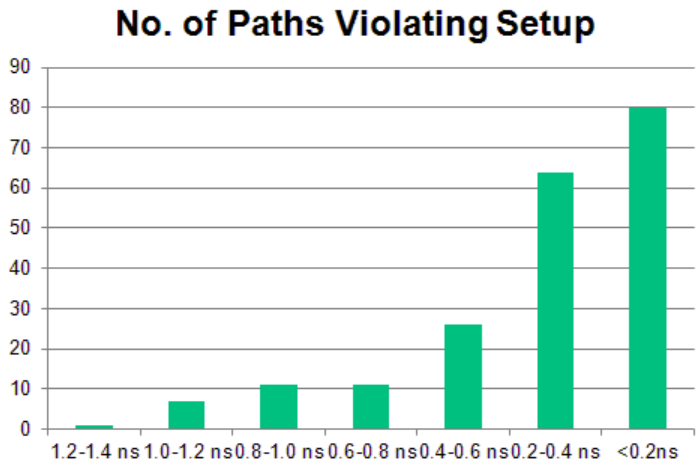

Fig 19. Virtuoso-GXL Setup Violation slack profile

After examination of the worst path between the 2 runs it was found that Encounter was optimizing 2 9X buffers to a single 18X buffer to optimize timing on this path as shown in **Figure 20** below. This replacement helps restrict the slew rate degradation long the path and causes the path to meet timing in the Encounter P&R run. Since the *Virtuoso-GXL* P&R was not run with timing constraints, this optimization did not occur. Constrained placement and routing in *Virtuoso-GXL* remains to be explored as part of future work.

Fig 20. Comparison of Virtuoso-GXL worst setup timing path with Encounter P&R run

The following table shows a brief comparison of timing, area and power between the *Encounter* and *Virtuoso-GXL* P&R flows.

	Encounter P&R flow	**Virtuoso P&R flow**
Clock Period	~2.6ns (385Mhz)	~3.92ns (255Mhz)
Total Power (max corner)	31.04 mW	30.44 mW
Total Internal Power (max corner)	14.42mW (41.45%)	13.34mW (43.82%)
Total Switching Power(max corner)	19.85 mW (57.05%)	16.57 mW (54.44%)
Total Leakage Power (max corner)	0.5228 mW (1.502%)	0.528mW (1.734%)
Total Leakage Power (min corner)	1.116 mW	1.13 mW
Total Area	48532.08 um^2	57806.58 um^2
Runtime		
Placement	< 2min	1 hr
Routing	< 2 min	24 hrs (can be improved using abstract views for std cells)

Table 2. Comparison of Encounter & Virtuoso-GXL P&R flows

As can be seen from **Table 2** above there are some tradeoffs using *Virtuoso-GXL* P&R tools on a larger design as compared to a standard tool like *Encounter*, primarily in terms of timing, area and tool runtime. However the motivation for creating this flow is to integrate small sized blocks for testchip design and the tradeoffs are not so severe in that case.

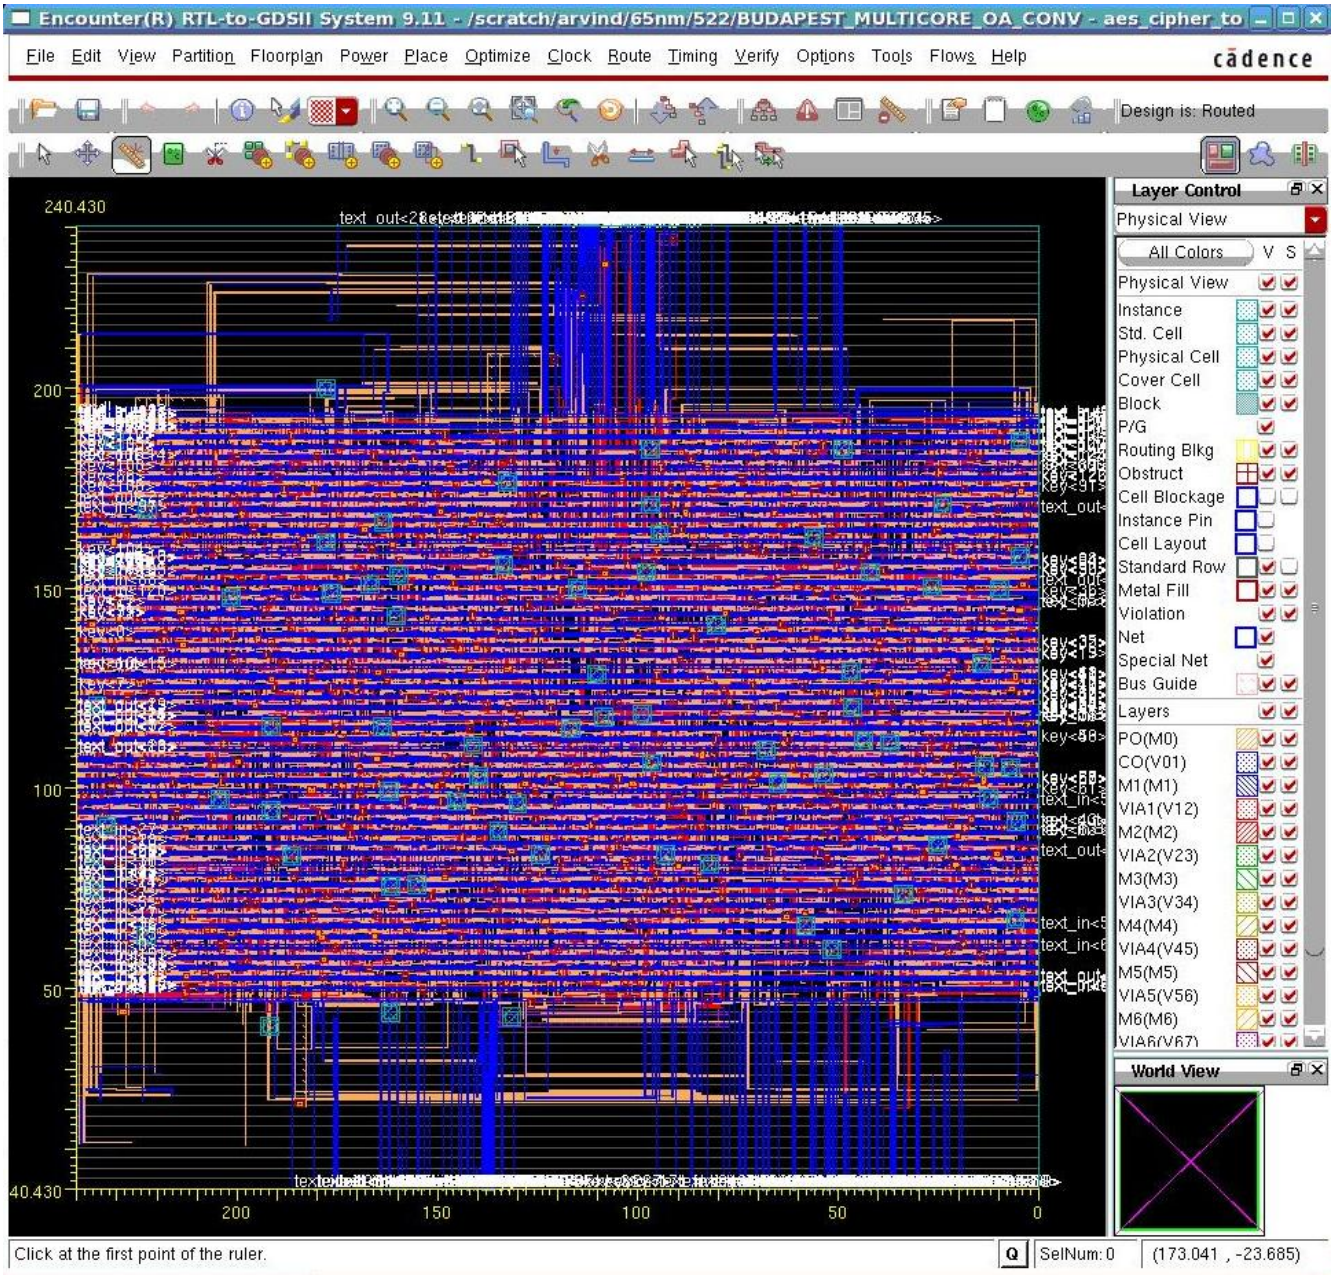

Fig 21. Virtuoso-GXL netlist imported into Encounter

Conclusion

This project attempted to provide an automated flow for placement and routing within the *Cadence Virtuoso* design environment. However, currently the flow is usable only for small to medium sized blocks. A method to run timing constrained placement and routing needs to be developed for larger designs in order to get better timing closure results on them at par with commercial P&R tools. Certain technology file modifications to guide the router have been effective in cutting down the number of DRC violations. However some violations still arise due to notches formed as a result of routing and the minimum number of via cuts for wide metal overlaps. Support needs to built into the tool to perform routing without these DRC rules.

```

	Matched Layout	Matched Source	Unmatched Layout	Unmatched Source	Component Type
Nets:	120	120	0	0	
Instances:	113	113	0	0	MD(d_mvtnfet)
	105	105	0	0	MD(d_mvtpfet)
	61	61	0	0	SMD2
	10	10	0	0	SMD3
Total Inst:	289	289	0	0	

o Statistics:

40 layout mos transistors were reduced to 20.
20 mos transistors were deleted by parallel reduction.

1 net was matched arbitrarily.

o Initial Correspondence Points:

Nets: vdd! gnd!

o Ambiguity Resolution Points:

(Each one of the following objects belongs to a group of indistinguishable objects.
The listed objects were matched arbitrarily by the Ambiguity Resolution feature of LVS.
Arbitrary matching may be prevented by assigning names to these objects or to adjacent nets).

Layout		Source
	Nets	
18		CLK_KILL

APPENDIX C:Encounter P&R log

```
Checking out Encounter license ...
Encounter_Digital_Impl_Sys_XL 9.1 license checkout succeeded.
You can run 2 CPU jobs with the base license that is currently checked out.
If required, use the setMultiCpuUsage command to enable multi-CPU processing.
This Encounter release has been compiled with OA version 22.04-p058.

@(#)CDS: Encounter v09.11-s084_1 (32bit) 04/26/2010 12:41 (Linux 2.6)
@(#)CDS: NanoRoute v09.11-s008 NR100226-1806/USR63-UB (database version 2.30,
93.1.1) {superthreading v1.14}
@(#)CDS: CeltIC v09.11-s011_1 (32bit) 03/04/2010 09:23:40 (Linux 2.6.9-
78.0.25.ELsmp)
@(#)CDS: CTE 09.11-s016_1 (32bit) Apr  8 2010 03:34:50 (Linux 2.6.9-
78.0.25.ELsmp)
@(#)CDS: CPE v09.11-s023
--- Starting "Encounter v09.11-s084_1" on Mon May  2 11:21:51 2011
(mem=46.5M) ---
--- Running on sody.ece.umn.edu (x86_64 w/Linux 2.6.18-194.26.1.el5) ---
This version was compiled on Mon Apr 26 12:41:13 PDT 2010.
Set DBUPerIGU to 1000.
Set net toggle Scale Factor to 1.00
Set Shrink Factor to 1.00000
<CMD> loadConfig cmd/encounter/aes_cipher_top.conf
Reading config file - cmd/encounter/aes_cipher_top.conf
**WARN: (ENCEXT-1085):  Option 'rda_Input(ui_res_scale)' used in
configuration file 'cmd/encounter/aes_cipher_top.conf' is obsolete. The name
will be converted into new format automatically if design is saved and then
restored. Alternatively, update the configuration file to use names
'rda_Input(ui_preRoute_res)' and/or 'rda_Input(ui_postRoute_res)' for
resistance scale factors to be used at preRoute/postRoute stages of the
design . The obsolete name works in this release. But to avoid this warning
and to ensure compatibility with future releases, update this option name.
```

```
Loading Lef file cds.lef...
Set DBUPerIGU to M2 pitch 200.
Initializing default via types and wire widths ...

***** !! NOTE !! *****

CTS treats D-pins and I/O pins as non-synchronous pins by default.
If you want to change the behavior, you need to use the SetDPinAsSync
or SetIoPinAsSync statement in the clock tree specification file,
or use the setCTSMode -traceDPinAsLeaf {true|false} command,
or use the setCTSMode -traceIoPinAsLeaf {true|false} command
before specifyClockTree command.

<CMD> extractRC
Extraction called for design 'aes_cipher_top' of instances=9549 and nets=9994
using extraction engine 'preRoute' .
**WARN: (ENCEXT-3530):  Use of command 'setDesignMode -process
<process_node>' prior to extraction is recommended for maximum accuracy and
optimal automatic threshold setting.
Default RC Extraction called for design aes_cipher_top.
**WARN: (ENCEXT-6166):  Using capacitance table file without EXTENDED section
is not recommended and will result in lower accuracy for clock nets in
preRoute extraction and for all nets when using postRoute extraction -
effortLevel low. Regeneration of full capacitance table is recommended.
RCMode: Default
Capacitance Scaling Factor   : 1.00000
Resistance Scaling Factor    : 1.00000
Clock Cap. Scaling Factor    : 1.00000
Clock Res Scaling Factor     : 1.00000
Shrink Factor                : 1.00000
Default RC extraction is honoring NDR/Shielding/ExtraSpace for clock nets.
Default RC Extraction DONE (CPU Time: 0:00:00.1  Real Time: 0:00:00.0  MEM:
544.934M)

#Dump tif for version 2.1
**WARN: (ENCEXT-3530):  Use of command 'setDesignMode -process
<process_node>' prior to extraction is recommended for maximum accuracy and
optimal automatic threshold setting.
**WARN: (ENCEXT-6166):  Using capacitance table file without EXTENDED section
is not recommended and will result in lower accuracy for clock nets in
preRoute extraction and for all nets when using postRoute extraction -
effortLevel low. Regeneration of full capacitance table is recommended.

**WARN: (ENCEXT-3497):  Options '-best/-worst/-typical' of 'readCapTable' are
obsolete. For single mode two corner analysis and optimization, use MMMC
setup instead of reading multiple captables through command 'readCapTable'.
The obsolete options still works in this release, but to avoid this warning
and to ensure compatibility with future releases, update your script and
configuration file to use MMMC.
Reading Three Cap Table files:  -typical

APPENDIX D: Virtuoso P&R Encounter Import log

```
Checking out Encounter license ...
Encounter_Digital_Impl_Sys_XL 9.1 license checkout succeeded.
You can run 2 CPU jobs with the base license that is currently checked out.
If required, use the setMultiCpuUsage command to enable multi-CPU processing.
This Encounter release has been compiled with OA version 22.04-p058.

\gnd! . This can compromise the delay calculation. Fix the netlist and re-run.
**WARN: (EMS-62):     Message <ENCDC-348> has exceeded the default message display limit of 20.
To avoid this warning, increase the display limit per unique message
by using the set_message_limit <number> command. The message limit can
be removed by using the unset_message_limit command. Note that setting
a very large number using the set_message_limit command or removing the
message limit using the unset_message_limit command can significantly
increase the log file size.
