Optimal Consecutive-k-out-of-(2k + 1): G Cycle

Ding-Zhu Du *‡ Frank K. Hwang † Yunjae Jung ‡ Hung Q. Ngo ‡ May 20, 2000

Abstract

We present a complete proof for the invariant optimal assignment for consecutive-k-out-of-(2k+1): G cycle, which was proposed by Zuo and Kao in 1990 with an incomplete proof, pointed out recently by Jalali, Hawkes, Cui, and Hwang.

Key Words: Invariant optimal assignment, consecutive-k-out-of-n: G cycle.

1 Introduction

A cyclic consecutive-k-out-of-n: G system $con_C(k,n:G)$ is a cycle of $n(\geq k)$ components such that the system works if and only if some k consecutive components all work. Suppose n components with reliabilities $p_{[1]} \leq p_{[2]} \leq \cdots \leq p_{[n]}$ are all exchangeable. How can they be assigned to the n positions on the cycle to maximize the reliability of the system? Kuo, Zhang, and Zuo [2] showed that if k=2, then the optimal assignment is invariant, i.e., it depends only on the ordering of reliabilities of the components, but not their value. Invariant optimal assignment is very important in practice. In fact, in the real world, one usually know the ranking of reliabilities of components, but not their exact values. For example, the ages of the components are known and one cannot compute the exact value of reliability from the age of each component. However, one may rank reliabilities of of components according to their age by the rule that the older the less reliable. Kuo, Zhang, and Zuo [2] also showed that for $k \geq 3$ and n > 2k + 1, $Con_C(k, n : G)$ has no invariant optimal assignment. For $n \leq 2k + 1$, Zuo and Kuo [3] claimed that there exists an invariant optimal assignment

$$(p_{[1]}, p_{[3]}, p_{[5]}, \cdots, p_{[6]}, p_{[4]}, p_{[2]}).$$

However, Jalali, Hawkes, Cui, and Hwang [1] found that their proof is incomplete. In this paper, we give a complete proof for this invariant optimal assignment in case n = 2k + 1.

A similar situation occurred in a line system. A linear consecutive-k-out-of-n: G system $Con_L(k, n : G)$ can be defined in a similar way to the cyclic system $Con_C(k, n : G)$. Kuo, Zhang, and Zuo [2] presented an invariant optimal assignment for $Con_L(k, n : G)$ with $n \leq 2k$. However, the proof is incomplete, too. This was also pointed out by Jalali et al. [1]. In addition, they gave a complete proof for the line system. It is worth pointing out that by setting $p_{[1]} = \cdots = p_{[2k+1-n]} = 0$, the cycle system $Con_C(k, 2k+1 : G)$ becomes the line system $Con_L(k, n : G)$. Thus, our result yields the result of Jalali et al. [1]. The cycle case is in general much more difficult than the line case, and our proof adopts a new approach different from previous attempts.

2 Main Result

In this section, we show the following.

Theorem 1 $Con_C(k, 2k + 1 : G)$ has invariant optimal assignment

$$(p_{[1]}, p_{[3]}, p_{[5]}, \cdots, p_{[2k+1]}, p_{[2k]}, \cdots, p_{[6]}, p_{[4]}, p_{[2]}).$$

Let $p_1, p_2, \dots, p_{2k+1}$ be reliabilities of the 2k+1 components on the cycle in counterclockwise direction. For simplicity of the proof, we first assume that

$$0 < p_{[1]} < p_{[2]} < \cdots < p_{[2k+1]} < 1.$$

Our proof is based on the following representation of the reliability of consecutive-k-out-of-n: G cycle for $n \leq 2k+1$

Lemma 1 The reliability of consecutive-k-out-of-n: G cycle for $n \leq 2k + 1$ under assignment C can be represented as

$$R(C) = p_1 \cdots p_n + \sum_{i=1}^{n} q_i p_{i+1} \cdots p_{i+k}$$

$$= p_1 \cdots p_n + \sum_{i=1}^{n} p_i \cdots p_{i+k-1} - \sum_{i=1}^{n} p_i \cdots p_{i+k}$$

where $q_i = 1 - p_i$ and $p_{n+i} = p_i$.

Proof. The system works if and only if all components work or for some i, the ith component fails and the (i + 1)st component, ..., the (i + k)th component all work. Since $n \le 2k + 1$, there exists at most one such i. Therefore,

$$R(C) = p_1 \cdots p_n + \sum_{i=1}^{n} q_i p_{i+1} \cdots p_{i+k}.$$

Note that

$$q_i p_{i+1} \cdots p_{i+k} = p_{i+1} \cdots p_{i+k} - p_i \cdots p_{i+k}.$$

This implies the second representation.

To prove Theorem 1, it suffices to show that in any optimal assignment,

$$(p_i - p_j)(p_{i-1} - p_{j+1}) > 0 \text{ for } 1 < i < j < 2k + 1.$$
(1)

That is, selecting any component to be labeled p_1 , we always have

$$(p_i - p_{2k+2-i})(p_{i+1} - p_{2k+1-i}) > 0 \text{ for } i = 1, \dots, k.$$
(2)

For simplicity of representation, we denote i' = 2k + 2 - i. Note that (k+1)' = k+1 and (i')' = i. Furthermore, without loss of generality, we assume $p_1 > p_{1'}$ throughout this proof. Then the condition (2) can be rewritten as

$$p_i > p_{i'} \text{ for } i = 1, \dots, k. \tag{3}$$

We will employ an inductive argument to prove these k inequalities in the following ordering:

$$p_1 > p_{1'}$$
 $p_k > p_{k'}$
 $p_2 > p_{2'}$
 $p_{k-1} > p_{(k-1)'}$

Let C_i be the assignment obtained from C by exchanging components i and i' and $C_{i,j,\dots,y,z} = (C_{i,j,\dots,y})_z$. Let C^* be an optimal assignment. We divide this inductive argument into the following lemmas.

Lemma 2 Under assumption that $p_1 > p_{1'}$, we must have $p_k > p_{k'}$ and $p_2 \cdots p_{k-1} \ge p_{2'} \cdots p_{(k-1)'}$.

Proof. Consider

$$0 \leq R(C^*) - R(C_1^*) = (p_1 - p_{1'})(p_2 \cdots p_k - p_{2'} \cdots p_{k'})q_{k+1}.$$

Since $p_1 > p_{1'}$, we have

$$p_2 \cdots p_k \ge p_{2'} \cdots p_{k'}. \tag{4}$$

Note that

$$0 \leq R(C^*) - R(C_k^*)$$

$$= (p_k - p_{k'})[(q_{1'}p_1 + q_1p_{k+1})p_2 \cdots p_{k-1} - (p_{1'}q_1 + q_{1'}p_{k+1})p_{2'} \cdots p_{(k-1)'}]$$
 (5)

and

$$(q_{1'}p_1 + q_1p_{k+1}) - (p_{1'}q_1 + q_{1'}p_{k+1}) = (p_1 - p_{1'})(1 - p_{k+1}) > 0.$$

We first claim that $p_k > p_{k'}$. In fact, if $p_2 \cdots p_{k-1} \ge p_{2'} \cdots p_{(k-1)'}$, then it follows from (5) that $p_k > p_{k'}$; If $p_2 \cdots p_{k-1} < p_{2'} \cdots p_{(k-1)'}$, then it follows from (4) that $p_k > p_{k'}$.

Now, we show that $p_2 \cdots p_{k-1} \geq p_{2'} \cdots p_{(k-1)'}$. Note that

$$0 \leq R(C^*) - R(C_{1,k}^*)$$

$$= [(p_1 p_k - p_{1'} p_{k'}) + (p_k - p_{k'}) p_{k+1} - p_{1'} p_1 (p_k - p_{k'})] (p_2 \cdots p_{k-1} - p_{2'} \cdots p_{(k-1)'}) q_{k+1}$$

$$= [(p_1 p_k q_{1'} - p_{1'} p_{k'} q_1) q_{k+1} + (1 - p_1 p_{1'}) (p_k - p_{k'}) p_{k+1}] (p_2 \cdots p_{k-1} - p_{2'} \cdots p_{(k-1)'}).$$

Moreover, $p_1q_{1'} - p_{1'}q_1 = p_1 - p_{1'} > 0$ and $p_k > p_{k'}$. Therefore, $p_2 \cdots p_{k-1} \ge p_{2'} \cdots p_{(k-1)'}$.

To show inductive step, we first prove an equality.

Lemma 3 Suppose m < k/2. Then

$$\sum_{i=1}^{2m+1} (\prod_{j=0}^{k-1} p_{-m+i+j} - \prod_{j=0}^{k} p_{-m+i+j})$$

$$= \sum_{i=1}^{m-1} (\prod_{j=1}^{i} p_{j}p_{j'})(p_{i+1}q_{(i+1)'})(\prod_{j=i+2}^{k-i} p_{j})[1 - (\prod_{j=k-i+1}^{k} p_{j}p_{j'})p_{k+1}]$$

$$+ \sum_{i=1}^{m} (1 - \prod_{j=1}^{i} p_{j}p_{j'})(\prod_{j=i+1}^{k-i} p_{j})(p_{k-i+1}q_{(k-i+1)'})(\prod_{j=k-i+2}^{k} p_{j}p_{j'})p_{k+1}$$

$$+ q_{1'}p_{1} \cdots p_{k}q_{k+1} + (\prod_{j=1}^{m} p_{j}p_{j'})(\prod_{j=m+1}^{k-m} p_{j})[1 - (\prod_{j=k-m+1}^{k} p_{j}p_{j'})p_{k+1}].$$

Proof. Note that

$$p_{1'}p_1\cdots p_{k+1}$$

$$= p_{1'}p_{1} \cdots p_{k+1}q_{k'} + p_{1'}p_{1} \cdots p_{k+1}p_{k'}$$

$$= p_{1'}p_{1} \cdots p_{k+1}q_{k'} + q_{2'}p_{1'}p_{1} \cdots p_{k+1}p_{k'} + p_{2'}p_{1'}p_{1} \cdots p_{k+1}p_{k'}$$

$$= \cdots$$

$$= \sum_{i=1}^{m-1} (\prod_{j=1}^{i} p_{j}p_{j'}) (\prod_{j=i+1}^{k-i} p_{j}) (p_{k-i+1}q_{(k-i+1)'}) (\prod_{j=k-i+2}^{k} p_{j}p_{j'}) p_{k+1}$$

$$+ \sum_{i=1}^{m} (\prod_{j=1}^{i} p_{j}p_{j'}) (p_{i+1}q_{(i+1)'}) (\prod_{j=i+2}^{k-i} p_{j}) (\prod_{j=k-i+1}^{k} p_{j}p_{j'}) p_{k+1}$$

$$+ (\prod_{j=1}^{m} p_{j}p_{j'}) (\prod_{j=m+1}^{k-m} p_{j}) (\prod_{j=k-m+1}^{k} p_{j}p_{j'}) p_{k+1}$$

and

$$p_1 \cdots p_k - p_{1'} p_1 \cdots p_k - p_1 \cdots p_{k+1}$$

$$= q_{1'} p_1 \cdots p_k q_{k+1} - p_{1'} p_1 \cdots p_{k+1}.$$

Thus,

$$\begin{split} &\sum_{i=1}^{2m+1} \prod_{j=0}^{k-1} p_{-m+i+j} - \prod_{j=0}^{k} p_{-m+i+j}) \\ &= \sum_{i=2}^{m} q_{-m+i-1} \prod_{j=0}^{k-1} p_{-m+i+j} + \sum_{i=m+2}^{2m+1} q_{-m+i+k} \prod_{j=0}^{k-1} p_{-m+i+j} \\ &+ p_{-m+1} \cdots p_{-m+k} + p_1 \cdots p_k - p_0 \cdots p_k - p_1 \cdots p_{k+1} \\ &= \sum_{i=1}^{m-1} (\prod_{j=1}^{i} p_j p_{j'}) (p_{i+1} q_{(i+1)'}) (\prod_{j=i+2}^{k-i} p_j) \\ &+ \sum_{i=1}^{m} (\prod_{j=i+1}^{k-i} p_j) (p_{k-i+1} q_{(k-i+1)'}) (\prod_{j=k-i+2}^{k} p_j p_{j'}) p_{k+1} \\ &+ (\prod_{j=1}^{m} p_j p_{j'}) (\prod_{j=m+1}^{k-m} p_j) + p_1 \cdots p_k - p_{1'} p_1 \cdots p_k - p_1 \cdots p_{k+1} \\ &= \sum_{i=1}^{m-1} (\prod_{j=1}^{i} p_j p_{j'}) (p_{i+1} q_{(i+1)'}) (\prod_{j=i+2}^{k-i} p_j) [1 - (\prod_{j=k-i+1}^{k} p_j p_{j'}) p_{k+1}] \\ &+ \sum_{i=1}^{m} (1 - \prod_{j=1}^{i} p_j p_{j'}) (\prod_{j=i+1}^{k-i} p_j) (p_{k-i+1} q_{(k-i+1)'}) (\prod_{j=k-i+2}^{k} p_j p_{j'}) p_{k+1} \end{split}$$

$$+q_{1'}p_1\cdots p_kq_{k+1}+(\prod_{j=1}^mp_jp_{j'})(\prod_{j=m+1}^{k-m}p_j)[1-(\prod_{j=k-m+1}^kp_jp_{j'})p_{k+1}].$$

Lemma 4 Suppose m < k/2. If

$$p_i > p_{i'} \text{ for } i = 1, \dots, m, k - m + 1, \dots, k$$
 (6)

and

$$\prod_{j=m+1}^{k-m} p_j \ge \prod_{j=m+1}^{k-m} p_{j'} \tag{7}$$

then

$$p_{m+1} > p_{(m+1)'}$$

and

$$\prod_{j=m+2}^{k-m} p_j \ge \prod_{j=m+2}^{k-m} p_{j'}.$$

Proof. We first show $p_{m+1} > p_{(m+1)'}$. For contradiction, suppose $p_{m+1} < p_{(m+1)'}$. It follows from (7) that

$$\prod_{j=m+2}^{k-m} p_j > \prod_{j=m+2}^{k-m} p_{j'}.$$
 (8)

By Lemma 3,

$$\begin{array}{ll} 0 & \leq & R(C^*) - R(C^*_{m+1}) \\ & = & \sum_{i=1}^{2m+1} (\prod_{j=0}^{k-1} p_{-m+i+j} - \prod_{j=0}^{k} p_{-m+i+j} + \prod_{j=0}^{k-1} p_{(-m+i+j)'} - \prod_{j=0}^{k} p_{(-m+i+j)'}) \\ & - & \sum_{i=1}^{2m+1} [\frac{p_{(m+1)'}}{p_{m+1}} (\prod_{j=0}^{k-1} p_{-m+i+j} - \prod_{j=0}^{k} p_{-m+i+j}) + \frac{p_{m+1}}{p_{(m+1)'}} (\prod_{j=0}^{k-1} p_{-m+i+j} - \prod_{j=0}^{k} p_{(-m+i+j)'})] \\ & = & (p_{m+1} - p_{(m+1)'}) \{ \sum_{i=1}^{m-1} (\prod_{j=1}^{i} p_{j}p_{j'}) [(p_{i+1}q_{(i+1)'}) (\prod_{j=i+2}^{m} p_{j}) (\prod_{j=m+2}^{k-i} p_{j}) \\ & - (p_{(i+1)'}q_{i+1}) (\prod_{j=i+2}^{m} p_{j'}) (\prod_{j=m+2}^{k-i} p_{j'})] [1 - (\prod_{j=k-i+1}^{k} p_{j}p_{j'}) p_{k+1}] \\ & + \sum_{i=1}^{m} (1 - \prod_{j=1}^{i} p_{j}p_{j'}) [(\prod_{j=i+1}^{m} p_{j}) (\prod_{j=m+2}^{k-i} p_{j}) (p_{k-i+1}q_{(k-i+1)'}) \end{array}$$

$$-(\prod_{j=i+1}^{m}p_{j'})(\prod_{j=m+2}^{k-i}p_{j'})(p_{(k-i+1)'}q_{k-i+1})](\prod_{j=k-i+2}^{k}p_{j}p_{j'})p_{k+1} + (q_{1'}p_{1}\cdots p_{m}p_{m+2}\cdots p_{k} - q_{1}p_{1'}\cdots p_{m'}p_{(m+2)'}\cdots p_{k'})q_{k+1} + (\prod_{j=1}^{m}p_{j}p_{j'})(\prod_{j=m+2}^{k-m}p_{j} - \prod_{j=m+2}^{k-m}p_{j'})[1 - (\prod_{j=k-m+1}^{k}p_{j}p_{j'})p_{k+1}]\} < 0,$$

a contradiction. The last inequality holds because it follows from (6) and (8) that every term in $\{\cdots\}$ is positive.

Now, we show

$$\prod_{j=m+2}^{k-m} p_j \ge \prod_{j=m+2}^{k-m} p_{j'}.$$

By Lemma 3, we have

$$\begin{array}{ll} 0 & \leq & R(C^*) - R(C^*_{m+2,\cdots,m-k}) \\ = & (\prod_{j=m+2}^{k-m} p_j - \prod_{j=m+2}^{k-m} p_{j'}) \\ & \cdot \{ \sum_{i=1}^{m-1} (\prod_{j=1}^{i} p_j p_{j'}) [(p_{i+1} q_{(i+1)'}) (\prod_{j=i+2}^{m+1} p_j) (\prod_{j=k-m+1}^{k-i} p_j) \\ & - (p_{(i+1)'} q_{i+1}) (\prod_{j=i+2}^{m+1} p_{j'}) (\prod_{j=k-m+1}^{k-i} p_{j'})] [1 - (\prod_{j=k-i+1}^{k} p_j p_{j'}) p_{k+1}] \\ & + \sum_{i=1}^{m} (1 - \prod_{j=1}^{i} p_j p_{j'}) [(\prod_{j=i+1}^{m+1} p_j) (\prod_{j=k-m+1}^{k-i} p_j) (p_{k-i+1} q_{(k-i+1)'}) \\ & - \prod_{j=i+1}^{m+1} p_{j'}) (\prod_{j=k-m+1}^{k-i} p_{j'}) (p_{(k-i+1)'} q_{k-i+1})] (\prod_{j=k-i+2}^{k} p_j p_{j'}) p_{k+1} \\ & + (q_{1'} p_1 \cdots p_{m+1} p_{k-m+1} \cdot p_k - q_1 p_{1'} \cdots p_{(m+1)'} p_{(k-m+1)'} \cdots p_{k'}) q_{k+1} \\ & + (\prod_{j=1}^{m} p_j p_{j'}) (p_{m+1} - p_{(m+1)'}) [1 - (\prod_{j=k-m+1}^{k} p_j p_{j'}) p_{k+1}] \}. \end{array}$$

It follows from (6) and $p_{m+1} > p_{(m+1)'}$ that every term in $\{\cdots\}$ is positive. Therefore,

$$\prod_{j=m+2}^{k-m} p_j \ge \prod_{j=m+2}^{k-m} p_{j'}.$$

Lemma 5 Suppose m < k/2. Then

$$\begin{split} &\sum_{i=1}^{2m+2} \prod_{j=0}^{k-1} p_{-m+i+j} - \sum_{i=1}^{2m+2} \prod_{j=0}^{k} p_{-m-1+i+j} \\ &= \sum_{i=1}^{m} (\prod_{j=1}^{i} p_{j} p_{j'}) (p_{i+1} q_{(i+1)'}) (\prod_{j=i+2}^{k-i} p_{j}) [1 - (\prod_{j=k-i+1}^{k} p_{j} p_{j'}) p_{k+1}] \\ &+ \sum_{i=1}^{m} (1 - \prod_{j=1}^{i} p_{j} p_{j'}) (\prod_{j=i+1}^{k-i} p_{j}) (p_{k-i+1} q_{(k-i+1)'}) (\prod_{j=k-i+2}^{k} p_{j} p_{j'}) p_{k+1} \\ &+ q_{1'} p_{1} \cdots p_{k} q_{k+1} \\ &+ (1 - \prod_{j=1}^{m} p_{j} p_{j'}) (\prod_{j=m+1}^{k-m} p_{j}) (\prod_{k-m+1}^{k} p_{j} p_{j'}) p_{k+1}. \end{split}$$

Proof. It is similar to the proof of Lemma 3.

Lemma 6 Suppose m < k/2. If

$$p_i > p_{i'} \text{ for } i = 1, \dots, m+1, k-m+1, \dots, k$$
 (9)

and

$$\prod_{j=m+2}^{k-m} p_j \ge \prod_{j=m+2}^{k-m} p_{j'} \tag{10}$$

then

$$p_{k-m} > p_{(k-m)'} \tag{11}$$

and

$$\prod_{j=m+2}^{k-m-1} p_j \ge \prod_{j=m+2}^{k-m-1} p_{j'}.$$
(12)

Proof. We first show (11). For contradiction, suppose $p_{k-m} > p_{(k-m)'}$.

$$\prod_{j=m+2}^{k-m-1} p_j > \prod_{j=m+2}^{k-m-1} p_{j'}.$$
(13)

By Lemma 5,

$$\begin{array}{ll} 0 & \leq & R(C^*) - R(C^*_{k-m}) \\ & = & (p_{k-m} - p_{(k-m)'}) \{ \sum_{i=1}^m (\prod_{j=1}^i p_j p_{j'}) [(p_{i+1} q_{(i+1)'}) (\prod_{j=i+2}^{k-m-1} p_j) (\prod_{j=k-m+1}^{k-m} p_j) \\ & - (p_{(i+1)'} q_{i+1}) (\prod_{j=i+2}^{k-m-1} p_{j'}) (\prod_{j=k-m+1}^{k-i} p_{j'})] [1 - (\prod_{j=k-i+1}^k p_j p_{j'}) p_{k+1}] \\ & + \sum_{i=1}^m (1 - \prod_{j=1}^i p_j p_{j'}) [(\prod_{j=i+1}^{k-m-1} p_j) (\prod_{j=k-m+1}^{k-i} p_j) (p_{k-i+1} q_{(k-i+1)'}) \\ & - (\prod_{j=i+1}^{k-m-1} p_{j'}) (\prod_{j=k-m+1}^{k-i} p_{j'}) (p_{(k-i+1)'} q_{k-i+1})] (\prod_{j=k-i+2}^{k} p_j p_{j'}) p_{k+1} \\ & + (q_{1'} p_1 \cdots p_{k-m-1} p_{k-m+1} \cdots p_k - q_1 p_{1'} \cdots p_{(k-m-1)'} p_{(k-m+1)'} \cdots p_{k'}) q_{k+1} \\ & + (1 - \prod_{j=1}^m p_j p_{j'}) (\prod_{j=m+1}^{k-m-1} p_j - \prod_{j=m+1}^{k-m-1} p_{j'}) (\prod_{k-m+1}^{k} p_j p_{j'}) p_{k+1} \} \\ & < 0, \end{array}$$

a contradiction.

Now, we prove (12). Consider

$$\begin{array}{ll} 0 & \leq & R(C^*) - R(C^*_{m+2,\cdots,k-m-1}) \\ & = & (\prod_{j=m+2}^{k-m-1} p_j - \prod_{j=m+2}^{k-m-1} p_{j'}) \\ & \cdot \{ \sum_{i=1}^m (\prod_{j=1}^i p_j p_{j'}) [(p_{i+1} q_{(i+1)'}) (\prod_{j=i+2}^{m+1} p_j) (\prod_{j=k-m}^{k-i} p_j) \\ & - (p_{(i+1)'} q_{i+1}) (\prod_{j=i+2}^{m+1} p_{j'}) (\prod_{j=k-m}^{k-i} p_{j'})] [1 - (\prod_{j=m-i+1}^k p_j p_{j'}) p_{k+1}] \\ & + \sum_{i=1}^m (1 - \prod_{j=1}^i p_j p_{j'}) [(\prod_{j=i+1}^{m+1} p_j) (\prod_{j=k-m}^{k-i} p_j) (p_{k-i+1} q_{(k-i+1)'}) \\ & - (\prod_{j=i+1}^{m+1} p_{j'}) (\prod_{j=k-m}^{k-i} p_{j'}) (p_{(k-i+1)'} q_{k-i+1})] (\prod_{j=k-i+2}^k p_j p_{j'}) p_{k+1} \\ & + (q_{1'} p_1 \cdots p_{m+1} p_{k-m} \cdots p_k - q_1 p_{1'} \cdots p_{(m+1)'} p_{(k-m)'} \cdots p_{k'}) q_{k+1} \\ & + (1 - \prod_{j=1}^m p_j p_{j'}) (p_{m+1} p_{k-m} - p_{(m+1)'} p_{(k-m)'}) (\prod_{k-m+1}^k p_j p_{j'}) p_{k+1} \}. \end{array}$$

It follows from (9) and (11) that every term in $\{\cdots\}$ is positive. Thus, (12) holds.

By Lemmas 2, 4, and 6, we know that (3) holds. Therefore, Theorem 1 is proved for $0 < p_{[1]} < \cdots < p_{[2k+1]} < 1$.

Finally, we deal with the case that some equality signs hold in $0 \le p_{[1]} \le p_{[2]} \le \cdots \le p_{[2k+1]} \le 1$. If $p_{[1]} = p_{[2]} = \cdots = p_{[2k+1]}$, then Theorem 1 is trivially true. If there exists i, $1 \le i < 2k+1$, such that $p_{[i]} < p_{[i+1]}$, then for sufficiently small $\varepsilon > 0$, we have

$$0 < p_{\lceil 1 \rceil} + \varepsilon < \dots < p_{\lceil i \rceil} + i\varepsilon < p_{\lceil i + 1 \rceil} - (2k + 1 - i)\varepsilon < \dots < p_{\lceil 2k + 1 \rceil} - \varepsilon < 1.$$

For them, we already proved the optimality of assignment C^* in Theorem 1, that is, for any assignment C, $R(C^*) \geq R(C)$. Now, we can complete our proof of Theorem 1 by setting $\varepsilon \to 0$.

3 Discussion

Zuo and Kuo [3] proved only that $R(C^*) \geq R(C_i^*)$ for any i. This cannot imply that $R(C^*) \geq R(C)$ for any assignment C. Thus, their proof is incomplete.

Note that $Con_C(k, n : G)$ for $n \leq 2k$ cannot be induced from $Con_C(k, 2k + 1 : G)$. Moreover, our inductive argument does not work in cycle system $Con_C(k, n : G)$ for $n \leq 2k$. Thus, some additional techniques are required to solve the general case.
