ANNUALS IN THE LANDSCAPE

Select annuals for the particular place where you're going to grow them. Golden Triumph or one of the other plumed celosias is a good choice for a bright warm location.

* * * *

Multiflora petunias are better bedding plants than the larger flowered grandiflora types. A single planting of Scarlet Satin in a sunny location gives summer impact to a bed by a walk or patio. Moonglow is a new pale yellow multiflora petunia which contrasts effectively with Plum Dandy, a fuchsia purple. For a cool and romantic effect in an old fashioned garden, White Dandy and Dawn Satin bring a pink and white combination for long season color.

* * * *

Annual beds should be only lightly fertilized. Adequate space--8 to 12 inches apart for dwarf bedding plants--will help control fungus disease and give you stronger plants.

* * * *

Other annuals for sunny locations include marigolds--both dwarf and tall African varieties--snapdragon, zinnias, and salvias.

* * * *

You can choose annuals for shady beds and borders from impatiens, browallia, fibrous rooted or wax begonias and coleus. These plants need plenty of water. Light applications of liquid fertilizer at monthly intervals may be helpful for your impatiens or begonias planted in confined spaces.
