Title:
Enteric-coated peppermint oil improves abdominal pain and
discomfort in patients with irritable bowel syndrome (IBS)

Key words:
Peppermint oil, irritable bowel syndrome, ibs, abdominal pain,
abdominal discomfort

Abstract:
Enteric-coated peppermint oil is a safe and effective agent for
relieving abdominal pain and discomfort, and for improving some
aspects of quality of life in patients with IBS. Adverse effects are generally mild, transient, and well-
tolerated, the most frequently reported symptoms being heartburn,
headache, and dizziness.

This document was created by a medical student enrolled in the
Primary Care Clerkship at the University of Minnesota Medical
School as part of the course project. The aim of the project is
to present information on a medical topic in the format of a
patient education handout. It does not necessarily reflect the
views of the University of Minnesota Medical School physicians
and faculty. These materials are provided for informational
purposes only and are in no way intended to take the place of the
advice and recommendations of your personal health care provider.
The information provided may no longer be up to date since it has
not been reviewed since the date of creation. The information
provided should not be used to diagnose a health problem or
disease, or as a means of determining treatment. In the event of
a medical emergency, immediately contact a doctor or call 911.
Peppermint oil for abdominal pain

Studies have shown that peppermint oil taken three times a day significantly relieves IBS-related abdominal pain compared to placebo.*

How does it work?
The main component of peppermint oil, menthol, helps to relax the smooth muscle of the intestine. This "antispasmodic" action is believed to improve abdominal pain.

Why peppermint oil?
- Peppermint oil is inexpensive and available over the counter
- Peppermint oil is safe and well-tolerated. Potential side effects are heartburn, headache, and dizziness.

*Peppermint oil has not been shown to improve constipation or diarrhea. Please talk to your doctor about your symptoms.

Irritable Bowel Syndrome

Overview

Causes
People with IBS have irregular patterns of intestinal motility, or movement. It is not clear why patients develop IBS, but these are some possibilities:

- Nerves or muscles in the digestive tract may be particularly sensitive to emotional stress and certain foods
- Hormonal changes may cause IBS
- IBS may be triggered by an infection

Diagnosis
Your doctor may recommend numerous tests to rule out other disorders of the intestinal tract. These tests may include:

- Lactose intolerance test
- Blood test
- Colonoscopy
- CT scan

Treatment
No single type of treatment works best for everyone, so you and your doctor will need to work together to create a treatment plan that will meet your needs. Here are some treatments your doctor may recommend:

- Keep a food diary, and avoid foods that appear to trigger or worsen symptoms
- Fiber and fluids can help relieve constipation
- Peppermint oil can help relieve abdominal pain
- Medications
- Stress relief
